# 1 1 Introduction

Web services represent the current generation of Internet technologies. They allow computer applications to exchange data directly over the Internet, essentially allowing modular or distributed computing in a more flexible fashion than ever before. In order to allow web services to function, however, many standards are required: for requesting and supplying data; for expressing the enveloping data which is used to package exchanged data; for describing web services to one another, to allow for easy integration into applications that use other web services as data resources.

9 SDMX, with its focus on the exchange of data using Internet technologies provides some of 10 these standards relating to statistical data and metadata. Many web-services standards already exist, however, and there is no need to re-invent them for use specifically within the 11 statistical community. Specifically, SOAP (which originally stood for the "Simple Object 12 13 Access Protocol") and the Web Services Description Language (WSDL) can be used by 14 SDMX to complement the data and metadata exchange formats they are standardizing. In the 15 web services world, the REST ("Representational State Transfer") protocol is also often used, relying on a URL-based syntax to invoke web services. Such REST-based services can be 16 described in a standard fashion using WADL ("Web Application Description Language"), in 17 18 the same way that XML-invoked web services based on SOAP can be described using 19 WSDL.

Despite the promise of SOAP and WSDL, it became evident from early implementations by vendors that these were not, in fact, interoperable. It was for this reason that the Web Services - Interoperability (WS-I) initiative was started. This consists of a group of vendors who have all implemented the same web-services standards the same way, and have verified this fact by doing interoperability tests. They publish profiles describing how to use web services standards interoperably. SDMX uses the work of WS-I as appropriate to meet the needs of the statistical community.

This document provides several SDMX-specific guidelines for using the existing standards in a fashion which will promote interoperability among SDMX web services, and allow for the creation of generic client applications which will be able to communicate meaningfully with any SDMX web service which implements these guidelines.

Much of the content of this document is not normative – instead the intention is to suggest a best practice in using SDMX-ML documents and web services standards for the exchange of statistical data and metadata. However, the SDMX WSDL and WADL files that formalise, in XML, the APIs described in this document are normative.

# 35 2 Web Services and SDMX-ML

36 Conventional applications and services traditionally expose their functionality through application programming interfaces (APIs). Web services are no different - they provide a 37 public version of the function calls which can be accessed over the web using web-services 38 39 protocols (SOAP or REST). In order to make a set of web services interoperate, it is 40 necessary to have a standard abstraction, or model, on which these public functions are 41 based. SDMX benefits from having a common information model, and it is a natural 42 extension to use the SDMX Information Model as the basis for standard web-services function calls. 43

Web services exchange data in an XML format: this is how the data passed between web
services is formatted. SDMX-ML, as a standard XML for exchanging data and structural
metadata within the statistical realm, provides a useful XML format for the public serialization
of web-services data. While there are some techniques for simple web-services data

exchanges – remote procedure calls (RPCs) – which are often used, the use of a set of XML
 exchanges based on a common information model is seen as a better approach for achieving
 interoperability.

51 There are several different document types available within SDMX-ML, and all are 52 potentially important to the creators and users of SDMX web services.

- 53
- The "Structure" Message: This message describes the concepts, data and metadata structure definitions, and code lists which define the structure of statistical data and reference metadata. Every SDMX-compliant data set or metadata set must have a data or metadata structure definition described for it. This XML description must be available from an SDMX web service when it is asked for.
- Che "Generic" Data Message: This is the "generic" way of marking up an SDMX data set. This schema describes a non-data-structure-definition-specific format for exchanging SDMX data, and it is a requirement that every SDMX data web service makes its data available in at least this form. It is expected that, in many instances, other data-structure-definition-specific XML forms for expressing data will also be supported in parallel services.
- 3. The "Structure Specific" Data Message: This is a standard schema format
  derived from the structure description using a standardized mapping, and many
  standard tags. It is specific to the structure of a particular data structure definition,
  and so every data structure definition will have its own "structure specific"
  schemas. It is designed to enable the exchange of large data sets, This is a data
  format that a web service may wish to provide, depending on the requirements of
  the data they exchange.
- 73 4. The "Query" Messages: This is the set of messages used to invoke SOAP-74 based SDMX web services. These messages all conform in a consistent way to a 75 master template, but are decomposed into specific queries to allow each service to support only those fields in the template message which are meaningful to it. 76 These guery messages are generic across all data and metadata structure 77 78 definitions, making queries in terms of the values specified for the concepts of a specific structure (as specified in a structure description). It allows users to query 79 80 for data, concepts, code lists, data and metadata structure definitions.
- 5. The "RegistryInterfaces" Message: All of the Registry Interfaces are subelements of this SDMX-ML Message type. They are more fully described in the
  SDMX Registry Specification.
- 84 6. The "Generic" Metadata Message: This is a message used to report reference
  85 metadata concepts, which is generic across all types of reference metadata
  86 structural descriptions.
- 7. The "Structure Specific" Metadata Message: This is a message used to report
   reference metadata concepts specific to a particular metadata structure definition.

# 3 SOAP-Based SDMX Web Services: WSDL Operations and Behaviours

# 91 **3.1 Introduction**

This section addresses the operations and behaviours specific to SOAP-based Web Services.
Most important is a list of standard WSDL operations, which will form the basis of, and be
accompanied by, actual standard WSDL XML instances, for use in development packages.
There are also several guidelines for the implementation of web services, to support
interoperability.

All SDMX SOAP web services should be described using WSDL instances. The global
element for each XML data and metadata format within SDMX should be specified as the
content of the replies to each exchange. The function names for each identified pattern are
specified below, along with the type of SDMX-ML payload.

Because SOAP RPC is not supported, the "parameters" of each function are simply an
instance of the appropriate SDMX-ML message type. As noted above, <wsdl:import> should
be used to specify the schema for a multiple-message exchange. The distributed WSDL files
illustrate how SOAP messages should be used.

105 The bindings included in the distributed WSDL files are according to SOAP 1.1.

# 106 3.2 The SDMX Web-Services Namespace

The SDMX Web Services namespace<sup>1</sup> contains a set of messages specific to the use of
 SOAP-based services. Each of the operations described will have a message to invoke the
 Web-Service, and a response message. In each case, these are refinements of other SDMX
 messages, appropriate to the operation being performed – these are described in the list of
 operations, below.

Additionally, there is a list of error codes to be used in the SOAP envelope (see the <u>standard</u>
 <u>error codes section</u>).

# 114 3.3 Support for WSDL Operations

An SDMX web service must support all of the listed operations, even if the support is minimal, and only involves the generation of an error explaining that the requested operation has not

been implemented. This is necessary for the sake of interoperability.

# 118 **3.4** *List of WSDL Operations*

For the use of SOAP and WSDL, the Web Services Interoperability specification version 1.1should be followed.

<sup>&</sup>lt;sup>1</sup> i.e., the declared namespace of the SDMX WSDL definition.

# 121 3.4.1 Data

# 122 3.4.1.1 GetStructureSpecificData

123 This operation is invoked using a GetStructureSpecificDataRequest message, and receives a 124 GetStructureSpecificDataResponse as a reply.

# 125 **3.4.1.2 GetGenericData**

- 126 This operation is invoked using a GetGenericDataRequest message, and receives a
- 127 GetGenericDataResponse as a reply.

# 128 3.4.1.3 GetStructureSpecificTimeSeriesData

129 This operation is invoked using a GetStructureSpecificTimeSeriesDataRequest message, and 130 receives a GetStructureSpecificTimeSeriesDataResponse as a reply.

# 131 3.4.1.4 GetGenericTimeSeriesData

- 132 This operation is invoked using a GetGenericTimeSeriesDataRequest message, and receives
- a GetGenericTimeSeriesDataResponse as a reply.

# 134 **3.4.2 Metadata**

# 135 3.4.2.1 GetGenericMetadata

This operation is invoked using a GetGenericMetadataRequest message, and receives a
 GetGenericMetdataResponse as a reply.

# 138 3.4.2.2 GetStructureSpecificMetadata

This operation is invoked using a GetStructureSpecificRequest message, and receives aGetStructureSpecificResponse as a reply.

# 141 **3.4.3 Structure usage**

# 142 **3.4.3.1 GetDataflow**

This operation is invoked using a GetDataflowRequest message, and receives aGetDataflowResponse as a reply.

# 145 **3.4.3.2 GetMetadataflow**

146 This operation is invoked using a GetMetadataflowRequest message, and receives a 147 GetMetadataflowResponse as a reply.

# 148 **3.4.4 Structure**

# 149 **3.4.4.1 GetDataStructure**

150 This operation is invoked using a GetDataStructureRequest message, and receives a 151 GetDataStructureResponse as a reply.

# 152 **3.4.4.2 GetMetadataStructure**

153 This operation is invoked using a GetMetadataStructureRequest message, and receives a 154 GetMetadataStructureResponse as a reply.

# 155 **3.4.5 Item scheme**

### 156 **3.4.5.1 GetCategoryScheme**

157 This operation is invoked using a GetCategorySchemeRequest message, and receives a 158 GetCategorySchemeResponse as a reply.

### 159 **3.4.5.2 GetConceptScheme**

- 160 This operation is invoked using a GetConceptSchemeRequest message, and receives a
- 161 GetConceptSchemeResponse as a reply.

#### 162 **3.4.5.3 GetCodelist**

163 This operation is invoked using a GetCodelistRequest message, and receives a 164 GetCodelistResponse as a reply.

# 165 3.4.5.4 GetHierarchicalCodelist

166 This operation is invoked using a GetHierarchicalCodelistRequest message, and receives a 167 GetHierarchicalCodelistResponse as a reply.

# 168 **3.4.5.5 GetOrganisationScheme**

- 169 This operation is invoked using a GetOrganisationsSchemeRequest message, and receives a
- 170 GetOrganisationSchemeResponse as a reply.

# 171 3.4.5.6 GetReportingTaxonomy

172 This operation is invoked using a GetReportingTaxonomyRequest message, and receives a 173 GetReportingTaxonomyResponse as a reply.

# 174 **3.4.6 Other maintainable artefacts**

# 175 **3.4.6.1 GetStructureSet**

- 176 This operation is invoked using a GetStructureSetRequest message, and receives a
- 177 GetStructureSetResponse as a reply.

# 178 **3.4.6.2 GetProcess**

- 179 This operation is invoked using a GetProcessRequest message, and receives a
- 180 GetProcessResponse as a reply.

# 181 **3.4.6.3 GetCategorisation**

182 This operation is invoked using a GetCategorisationRequest message, and receives a 183 GetCategorisationResponse as a reply.

# 184 **3.4.6.4 GetProvisionAgreement**

This operation is invoked using a GetProvisionAgreementRequest message, and receives a
 GetProvisionAgreementResponse as a reply.

# 187 **3.4.6.5 GetConstraint**

- 188 This operation is invoked using a GetConstraintRequest message, and receives a
- 189 GetConstraintResponse as a reply.

# 190 **3.4.7 XML Schemas (XSD)**

# 191 3.4.7.1 GetDataSchema

192 This operation is invoked using a GetDataSchemaRequest message, and receives a 193 GetDataSchemaResponse as a reply.

# 194 3.4.7.2 GetMetadataSchema

195 This operation is invoked using a GetMetadataSchemaRequest message, and 196 receives a GetMetadataSchemaResponse as a reply.

# 197 **3.4.8 Generic query for structural metadata**

# 198 **3.4.8.1 GetStructures**

- 199 This operation is invoked using a GetStructuresRequest message, and receives a 200 GetStructuresResponse as a reply.
- 201

# 202 3.5 Other Behaviours

# 203 **3.5.1 Versioning Defaults**

When no version is specified in the message invoking a service, the default is to return the last production version of the resource(s) requested.

# 206 3.5.2 Resolving References and Specifying Returned Objects

207 Version 2.1 of the SDMX-ML Query message offers new functionality to resolve reference 208 and specify the type of objects to be returned. The SOAP API relies on this mechanism for

resolving references and specifying returned objects. See Section "<u>Applicability and meaning</u>
 <u>of references attribute</u>".

# 211 **3.5.3 Enabling compression**

212 Compression should be enabled using the appropriate HTTP Header field (Accept-Encoding).

# 213 **3.5.4 Implementation of the SOAP based SDMX Web Services**

214 In the SDMX Web Services, the development is Contract-First since the WSDL has been specified by the standard. Furthermore it is a Web Service of already prepared XML 215 messages requests/responses, i.e. the interfaces for the application logic are the XML 216 217 messages. Therefore there is no need to generate stubs for serialisation and de-serialisation of the SOAP payloads from/to the native language classes. The indicative way is to have full 218 control on the XML messages requests/responses. When using the automatic generation of 219 code it will include an extra element for the parameter of the operation in the SOAP request 220 221 according to the RPC paradigm, and to the SOAP specifications that is not desired according 222 to the standardised SDMX WSDL.

When using Apache Axis in Java, an interface for the service is offered by the toolkit that reads/returns the XML payloads using DOM elements (DOMElement in Axis2). Moreover when using the Java API for XML Web Services (JAX-WS), the developer can use the Provider<SOAPMessage> interface, where he is responsible for creating the SOAP request and response messages as well as specifying the standardised WSDL of the service.

However in the .NET environment there is no similar solution for this. The developer of the service will have to use the XmlAnyElement parameter for the .NET web methods. This specifies that the parameter of the Service method can be any XML element thus allows the developer to take control of the XML payload. The details of this approach are presented in the "Annex I: How to eliminate extra element in the .NET SDMX Web Service" in the section 06 of the SDMX documentation.

# 234 **3.5.5 Compliance with WS-I**

To ensure interoperability between SDMX web services, compliance with sections of the WS-I Profile 1.1 is recommended for all SDMX web services. The documentation can be found at <u>http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html</u>. The recommended sections are those concerning the use of SOAP and WSDL. UDDI, while useful for advertising the existence of SDMX web services, is not necessarily central to SDMX interoperability.

# 240 4 SDMX RESTful API

243

244 245

# 241 **4.1 A Brief Introduction to REST**

- 242 This SDMX API is based on the REST principles, as described below:
  - In REST, specific information is known as "**Resource**". In SDMX, specific resources would be, for example, code lists, concept schemes, data structure definitions, dataflows, etc. Each resource is addressable via a **global identifier** (i.e.: a URI).
- Manipulating resources is done using methods defined in the HTTP protocol (e.g.: GET, POST, PUT, DELETE). This API focuses on data retrieval, and, therefore, only the usage of HTTP GET is covered in this document.

A resource can be represented in various formats (such as the different flavours and versions of the SDMX-ML standard). Selection of the appropriate **representation** is done using HTTP Content Negotiation and the HTTP Accept request header.

# 252 **4.2** Scope of the API

257

258

259

260 261

262 263

264

265

266 267

268

269 270

271

272

273

274

275

289

290

291

The RESTful API focuses on simplicity. The aim is not to replicate the full semantic richness of the SDMX-ML Query message but to make it simple to perform a limited set of standard queries. Also, in contrast to other parts of the SDMX specification, the RESTful API focuses solely on data retrieval (via HTTP GET). More specifically, the API allows:

- To retrieve structural metadata, using a combination of id, agencyID and version number.
  - To retrieve statistical data or reference metadata using keys (with options for wildcarding and support for the OR operator), data or metadata flows and data or metadata providers.
- To further refine queries for statistical data or reference metadata using time information (start period and end period).
  - To retrieve updates and revisions only.
  - To return the results of a query in various formats. The desired format and version of the returned message will be specified using HTTP Content Negotiation (and the HTTP Accept request header).
  - For structural metadata, it is possible to instruct the web service to resolve references (for instance, when querying for data structure definitions, it is possible to also retrieve the concepts and code lists used in the returned data structure definitions), as well as artefacts that use the matching artefact (for example, to retrieve the dataflows that use a matching data structure definition).
- For structural metadata, it is possible to retrieve a minimal version of the artefact, for the sake of efficiency (for example, to retrieve all code lists – names, ids, etc – without the codes).
- A distinction should be established between the elements that allow identifying the resource to be retrieved and the elements that give additional information about, or allow to further filter, the desired results. Elements belonging to the 1<sup>st</sup> category are specified in the path part of the URL while elements belonging to the 2<sup>nd</sup> category are specified in the query string part of the URL.

# 281 **4.3** Structural Metadata Queries

282 **4.3.1 Resources** 

283 The following resources are defined:

- datastructure<sup>2</sup>
- metadatastructure<sup>3</sup>
- e categoryscheme
- conceptscheme
- codelist
  - hierarchicalcodelist
    - organisationscheme<sup>4</sup>
  - agencyscheme<sup>5</sup>

<sup>&</sup>lt;sup>2</sup> This has been shortened from DataStructureDefinition to allow for shorter URLs.

<sup>&</sup>lt;sup>3</sup> This has been shortened from MetadataStructureDefinition to allow for shorter URLs.

<sup>&</sup>lt;sup>4</sup> The organisationscheme resource can be used whenever the role played by the organisation schemes

<sup>(</sup>e.g. maintenance agencies) is not known/relevant.

| 292 | ٠ | dataproviderscheme     |
|-----|---|------------------------|
| 293 | • | dataconsumerscheme     |
| 294 | • | organisationunitscheme |
| 295 | • | dataflow               |
| 296 | • | metadataflow           |
| 297 | • | reportingtaxonomy      |
| 298 | • | provisionagreement     |
| 299 | • | structureset           |
| 300 | • | process                |

| 302 | • | contentconstraint      |
| 303 | • | attachmentconstraint   |
| 304 | ٠ | structure <sup>6</sup> |

# **305 4.3.2 Parameters**

# **4.3.2.1 Parameters used for identifying a resource**

307 The following parameters are used for identifying resources:

| Parameter  | Туре   | Description  |
|------------|--|--|
| agencyID   | A string compliant with the<br>SDMX<br>common:NCNameIDType | The agency maintaining the artefact to be returned |
| resourceID | A string compliant with the SDMX common: IDType            | The id of the artefact to be returned              |
| version    | A string compliant with the<br>SDMX<br>common:VersionType  | The version of the artefact to be returned         |

- 308 The parameters mentioned above are specified using the following syntax:
- 309 protocol://ws-entry-point/resource/agencyID/resourceID/version
- 310 Furthermore, some keywords may be used:

| Keyword          | Scope      | Description  |
|------------------|------------|--|
| all <sup>7</sup> | agencyID   | Returns artefacts maintained by any maintenance agency                           |
| all              | resourceID | Returns all resources of the type defined by the resource parameter <sup>8</sup> |

<sup>&</sup>lt;sup>5</sup> For 3 of the subtypes of OrganisationScheme (AgencyScheme, DataProviderScheme and DataConsumerScheme), the id and version parameters have fixed values. See Section 03 of the SDMX information model document for additional information.

<sup>6</sup> This type can be used to retrieve any type of structural metadata matching the supplied parameters. <sup>7</sup> As "all" is a reserved keyword in the SDMX RESTful API, it is recommended not to use it as an

identifier for agencies, resources or a specific version.

<sup>&</sup>lt;sup>8</sup> Default, if parameter not specified

| all    | version | Returns all versions of the resource                     |
|--------|---------|--|
| latest | version | Returns the latest version in production of the resource |

311

313

314

315

316

317

318

319

320

321

312 The following rules apply:

- If no version is specified, the version currently used in production should be returned. It is therefore equivalent to using the keyword "latest".
  - If no agencyID is specified, the matching artefacts maintained by any maintenance agency should be returned. It is therefore equivalent to using the keyword "all"<sup>9</sup>.
  - If no resourceID is specified, all matching artefacts (according to the other criteria used) should be returned. It's is therefore equivalent to using the keyword "all".
  - If no parameters are specified, the "latest" version of "all" resources of the type identified by the resource parameter, maintained by any maintenance agency should be returned.

# **4.3.2.2 Parameters used to further describe the desired results**

The following parameters are used to further describe the desired results, once the resource has been identified. As mentioned in 3.2, these parameters appear in the query string part of the URL.

| Parameter  | Туре   | Description  | Default |
|------------|--------|--|---------|
| detail     | String | This attribute specifies the desired amount<br>of information to be returned. For example,<br>it is possible to instruct the web service to<br>return only basic information about the<br>maintainable artefact (i.e.: id, agency id,<br>version and name). Most notably, items of<br>item schemes will not be returned (for<br>example, it will not return the codes in a<br>code list query). Possible values are:<br>"allstubs" (all artefacts should be returned<br>as stubs <sup>10</sup> ), "referencestubs" (referenced<br>artefacts should be returned as stubs <sup>11</sup> ) and<br>full (all available information for all artefacts<br>should be returned <sup>12</sup> ) <sup>13</sup> . | full    |
| references | String | This attribute instructs the web service to<br>return (or not) the artefacts referenced by<br>the artefact to be returned (for example, the<br>code lists and concepts used by the data<br>structure definition matching the query), as  | none    |

<sup>&</sup>lt;sup>9</sup> This would potentially return more than one artefact, if different agencies give the same identifier to a resource (for example, <u>http://ws-entry-point/codelist/all/CL\_FREQ</u>, could return more than one codelist if more than one agency is maintaining a codelist with id "CL\_FREQ").

<sup>&</sup>lt;sup>10</sup> The equivalent in SDMX-ML query is: Stub at the query level and Stub at the reference level.

<sup>&</sup>lt;sup>11</sup> The equivalent in SDMX-ML query is: Full at the query level and Stub at the reference level.

<sup>&</sup>lt;sup>12</sup> The equivalent in SDMX-ML query is: Full at the query level and Full at the reference level.

<sup>&</sup>lt;sup>13</sup> In case a stub is returned, the isExternalReference attribute of the returned artefact(s) should be set to "true" and the location where the full version of the artefact(s) can be downloaded should be specified in the structureURL attribute.

| well as the artefacts that use the matching<br>artefact (for example, the dataflows that use<br>the data structure definition matching the<br>query). Possible values are: "none" (no<br>references will be returned), "parents" (the<br>artefacts that use the artefact matching the<br>query), "parentsandsiblings" (the artefacts<br>that use the artefact matching the query, as<br>well as the artefacts referenced by these<br>artefacts), "children" (artefacts referenced<br>by the artefact to be returned), |  |
|---|--|
| query), "parentsandsiblings" (the artefacts   |  |
| artefacts), "children" (artefacts referenced  |  |
| "descendants" (references of references, up<br>to any level, will also be returned), "all" (the<br>combination of parentsandsiblings and  |  |
| descendants). In addition, a concrete type of resource, as defined in <u>3.3.1</u> , may also be used (for example, references=codelist).   |  |

#### 4.3.2.3 Applicability and meaning of references attribute

The table below lists the 1<sup>st</sup> level artefacts (one level up, one level down) that will be returned if the references parameter is set to "all". Artefacts referenced by the matching artefact are 

displayed in regular style, while the artefacts that reference the matching artefact are 

| 330 | displayed i | n Italic. |
|-----|-------------|-----------|
|     |             |           |

| Maintainable artefact | Artefacts returned   |
|-----------------------|--|
| AgencyScheme          | Categorisation<br>Process<br>MetadataStructureDefinition<br>StructureSet   |
| Categorisation        | All  |
| CategoryScheme        | Categorisation<br>Process<br>StructureSet  |
| Codelist              | Categorisation<br>Process<br>HierarchicalCodelist<br>ConceptScheme<br>DataStructureDefinition<br>MetadataStructureDefinition<br>StructureSet |
| ConceptScheme         | Categorisation<br>Process<br>Codelist<br>DataStructureDefinition<br>MetadataStructureDefinition<br>StructureSet                              |
| Constraint            | Categorisation<br>Process<br>DataProviderScheme<br>DataStructureDefinition   |

|                             | Dataflow<br>MetadataStructureDefinition<br>Metadataflow<br>ProvisionAgreement  |
|-----------------------------|--|
| DataConsumerScheme          | Categorisation<br>Process<br>MetadataStructureDefinition<br>StructureSet   |
| Dataflow                    | Categorisation<br>Process<br>Constraint<br>DataStructureDefinition<br>ProvisionAgreement<br>ReportingTaxonomy<br>StructureSet  |
| DataProviderScheme          | Categorisation<br>Process<br>Constraint<br>ProvisionAgreement<br>MetadataStructureDefinition<br>StructureSet   |
| DataStructureDefinition     | Categorisation<br>Process<br>Codelist<br>ConceptScheme<br>Constraint<br>Dataflow<br>StructureSet   |
| HierarchicalCodelist        | Categorisation<br>Process<br>Codelist<br>StructureSet  |
| Metadataflow                | Categorisation<br>Process<br>Constraint<br>MetadataStructureDefinition<br>ProvisionAgreement<br>ReportingTaxonomy<br>StructureSet  |
| MetadataStructureDefinition | Categorisation<br>Process<br>ConceptScheme<br>Codelist<br>DataProviderScheme<br>DataConsumerScheme<br>AgencyScheme<br>OrganisationUnitScheme<br><i>Constraint</i><br><i>Metadataflow</i> |

|                        | StructureSet  |
|------------------------|---|
| OrganisationUnitScheme | Categorisation<br>Process<br>Constraint<br>MetadataStructureDefinition<br>StructureSet  |
| Process                | All   |
| ProvisionAgreement     | Categorisation<br>Process<br>DataProviderScheme<br>Dataflow<br>Metadataflow<br><i>Constraint</i>  |
| ReportingTaxonomy      | Categorisation<br>Process<br>Dataflow<br>Metadataflow<br>StructureSet   |
| StructureSet           | Categorisation<br>Process<br>DataStructureDefinition<br>MetadataStructureDefinition<br>CategoryScheme<br>DataProviderScheme<br>DataConsumerScheme<br>AgencyScheme<br>OrganisationUnitScheme<br>ConceptScheme<br>Codelist<br>ReportingTaxonomy<br>HierarchicalCodelist<br>Dataflow<br>Metadataflow |

# 331 4.3.3 Examples

332

- To retrieve version 1.0 of the DSD with id ECB\_EXR1 maintained by the ECB, as well as the
 code lists and the concepts used in the DSD:

335 http://ws-entry-point/datastructure/ECB/ECB\_EXR1/1.0?references=children

- To retrieve the latest version in production of the DSD with id ECB\_EXR1 maintained by the
 ECB, without the code lists and concepts of the DSD:

338 <u>http://ws-entry-point/datastructure/ECB/ECB\_EXR1</u>

- To retrieve all DSDs maintained by the ECB, as well as the dataflows using theseDSDs:

- 341 http://ws-entry-point/datastructure/ECB?references=dataflow
- To retrieve the latest version in production of all code lists maintained by all maintenance
   agencies, but without the codes:
- 344 http://ws-entry-point/codelist?detail=allstubs
- To retrieve, as stubs, the latest version in production of all maintainable artefacts maintainedby the ECB:
- 347 <u>http://ws-entry-point/structure/ECB?detail=allstubs</u>
- 348

# 349 4.4 Data and Metadata Queries

#### 350 **4.4.1 Resources**

- 351 The following resources should be supported:
- 352 data
- metadata

# 354 **4.4.2 Parameters**

# **4.4.2.1 Parameters used for identifying a resource**

356 The following parameters are used for identifying resources in data queries:

| Parameter             | Туре   | Description   |
|-----------------------|--|---|
| flowRef <sup>14</sup> | A string identifying the dataflow.<br>The syntax is agency id, artefact<br>id, version, separated by a ",". For<br>example:<br>AGENCY_ID,FLOW_ID,VERSION<br>In case the string only contains<br>one out of these 3 elements, it is<br>considered to be the flow id, i.e.<br>all,FLOW_ID,latest<br>In case the string only contains<br>two out of these 3 elements, they<br>are considered to be the agency<br>id and the flow id, i.e.<br>AGENCY_ID,FLOW_ID,latest | The data (or metadata) flow of the data<br>(or metadata) to be returned   |
| key                   | A string compliant with the<br>KeyType defined in the SDMX<br>WADL.  | The key of the artefact to be returned.<br>Wildcarding is supported by omitting the<br>dimension code for the dimension to be<br>wildcarded. For example, if the<br>following series key identifies the<br>bilateral exchange rates for the daily US<br>dollar exchange rate against the euro,<br>D.USD.EUR.SP00.A, then the following<br>series key can be used to retrieve the<br>data for all currencies against the euro:<br>DEUR.SP00.A. The OR operator is<br>supported using the + character. For<br>example, the following series key can<br>be used to retrieve the exchange rates<br>against the euro for both the US dollar<br>and the Japanese Yen: |

<sup>&</sup>lt;sup>14</sup> It's a common use case in SDMX-based web services that the flow id is sufficient to uniquely identify a dataflow. Should this not be the case, the agency id and the dataflow version, can be used, in conjunction with the flow id, in order to uniquely identify a dataflow.

|                           |  | D.USD+JPY.EUR.SP00.A.  |
|---------------------------|--|--|
| providerRef <sup>15</sup> | A string identifying the provider.<br>The syntax is agency id, provider<br>id, separated by a ",". For<br>example:<br>AGENCY_ID,PROVIDER_ID.<br>In case the string only contains<br>one out of these 2 elements, it is<br>considered to be the provider id,<br>i.e. all,PROVIDER_ID. | The provider of the data (or metadata)<br>to be retrieved. If not supplied, the<br>returned message will contain data (or<br>metadata) provided by any provider. |

357

- 358 The parameters mentioned above are specified using the following syntax:
- 359 protocol://ws-entry-point/resource/flowRef/key/providerRef

#### 360 Furthermore, some keywords may be used:

| Keyword           | Scope       | Description   |
|-------------------|-------------|---|
| all               | key         | Returns all data belonging to the specified dataflow and provided by the specified provider.                                    |
| all <sup>16</sup> | providerRef | Returns all data matching the supplied key and belonging to the specified dataflow that has been provided by any data provider. |

361

366

367

362 The following rules apply:

| 363 | • | If no key is specified, all data (or metadata) belonging to the dataflow (or           |
|-----|---|--|
| 364 |   | metadataflow) identified by the flowRef should be supplied. It is therefore equivalent |
| 365 |   | to using the keyword "all".  |

• If no providerRef is specified, the matching data (or metadata) provided by any data provider should be returned. It is therefore equivalent to using the keyword "all".

# **4.4.2.2 Parameters used to further filter the desired results**

The following parameters are used to further describe (or filter) the desired results, once the resource has been identified. As mentioned in <u>3.2</u>, these parameters go in the query string part of the URL.

| Parameter   | Туре  | Description   |
|-------------|---|---|
| startPeriod | common:StandardTimePeriodType,<br>as defined in the | The start period for which results should be supplied |

<sup>&</sup>lt;sup>15</sup> It's a common use case in SDMX-based web services that the provider id is sufficient to uniquely identify a data provider. Should this not be the case, the agency can be used, in conjunction with the provider id, in order to uniquely identify a data provider. <sup>16</sup> As "all" is a reserved keyword in the SDMX RESTful API, it is recommended not to use it as an

<sup>&</sup>lt;sup>16</sup> As "all" is a reserved keyword in the SDMX RESTful API, it is recommended not to use it as an identifier for providers.

| Γ            |   |  |
|--------------|---|--|
|              | SDMXCommon.xsd schema.  | (inclusive).   |
|              | Can be expressed using <sup>17</sup> :  |  |
|              | <ul> <li>dateTime: all data that falls<br/>between the calendar<br/>dates will be matched</li> </ul>  |  |
|              | <ul> <li>Gregorian Period: all data<br/>that falls between the<br/>calendar dates will be<br/>matched</li> </ul>  |  |
|              | <ul> <li>Reporting Period: all data<br/>reported as periods that fall<br/>between the specified<br/>periods will be returned.<br/>When comparing reporting<br/>weeks and days to higher<br/>order periods (e.g.<br/>quarters) one must account<br/>for the actual time frames<br/>covered by the periods to<br/>determine whether the data<br/>should be included. Data<br/>reported as Gregorian<br/>periods or distinct ranges<br/>will be returned if it falls<br/>between the specified<br/>reporting periods, based on<br/>a reporting year start day<br/>of January 1.</li> </ul> |  |
|              | In case the : or + characters are used, the parameter must be percent-encoded by the client <sup>18</sup> .   |  |
|              | Note that this value is assumed to be inclusive to the range of data being sought.  |  |
| endPeriod    | Same as above   | The end period for which results should be supplied (inclusive).   |
| updatedAfter | xs:dateTime   | The last time the query<br>was performed by the<br>client in the database. If<br>this attribute is used, the<br>returned message should<br>only include the latest |

 <sup>&</sup>lt;sup>17</sup> For additional information, see section 4.2.14 of Section 06 (SDMX Technical Notes).
 <sup>18</sup> See <u>http://en.wikipedia.org/wiki/URL encoding#Percent-encoding reserved characters</u> for additional information.

|                        |   | <ul> <li>version of what has<br/>changed in the database<br/>since that point in time<br/>(updates and revisions).<br/>This should include:</li> <li>Observations<sup>19</sup> that have<br/>been added since the last<br/>time the query was<br/>performed (INSERT).</li> <li>Observations that have<br/>been revised since the last<br/>time the query was<br/>performed (UPDATE).</li> <li>Observations that have<br/>been deleted since the last<br/>time the query was<br/>performed (DELETE).</li> <li>If no offset is specified,<br/>default to local time of the<br/>web service.</li> </ul> |
|------------------------|---|--|
| firstNObservations     | Positive integer  | Integer specifying the<br>maximum number of<br>observations to be<br>returned for each of the<br>matching series, starting<br>from the first observation   |
| lastNObservations      | Positive integer  | Integer specifying the<br>maximum number of<br>observations to be<br>returned for each of the<br>matching series, counting<br>back from the most recent<br>observation   |
| dimensionAtObservation | A string compliant with the SDMX<br>common:NCNameIDType | The ID of the dimension to<br>be attached at the<br>observation level. This<br>parameter allows the<br>client to indicate how the<br>data should be packaged<br>by the service. The options<br>are "TIME_PERIOD" (a<br>timeseries view of the<br>data), the ID of any other  |

<sup>&</sup>lt;sup>19</sup> If the information about when the data has been updated is not available at the observation level, the web service should return either the series that have changed (if the information is attached at the series level) or the dataflows that have changed (if the information is attached at the dataflow level).

|        |        | dimension used in that<br>dataflow (a cross-sectional<br>view of the data) or the<br>keyword "AllDimensions"<br>(a "flat" view of the data<br>where the observations<br>are grouped neither by<br>time nor by a non-time<br>cross section). In case this<br>parameter is not set, the<br>service is expected to:<br>- Default to<br>TimeDimension, if the data<br>structure definition has<br>one;<br>- If not, default to<br>MeasureDimension , if the<br>data structure definition<br>has one;<br>- If none of the above is<br>true, default to<br>AllDimensions.  |
|--------|--------|--|
| detail | String | This attribute specifies the desired amount of information to be returned. For example, it is possible to instruct the web service to return data only (i.e. no attributes). Possible options are: "full" (all data and documentation, including annotations - This is the default), "dataonly" (attributes – and therefore groups – will be excluded from the returned message), "serieskeysonly" (returns only the series elements and the dimensions that make up the series keys. This is useful for performance reasons, to return the series that match a certain query, without returning the actual data), "nodata" (returns the groups and series, including attributes and annotations, without observations). |

373 The table below defines the meaning of parameters combinations:

| startPeriod with no endPeriod                                    | Until the most recent  |
|--|--|
| endPeriod and no startPeriod                                     | From the beginning   |
| startPeriod and endPeriod  | Within the supplied time range   |
| lastNObservations + startPeriod/endPeriod                        | The specified number of observations,<br>starting from the end, within the supplied time<br>range  |
| firstNObservations + startPeriod/endPeriod +<br>updatedAfterDate | The specified number of observations,<br>starting from the beginning, that have<br>changed since the supplied timestamp, within<br>the supplied time range |
| updatedAfterDate + startPeriod/endPeriod                         | The observations, within the supplied time range, that have changed since the supplied timestamp.  |

# 374 **4.4.3 Examples**

| 375<br>376 | • | To retrieve the data for the series M.USD.EUR.SP00.A supplied by the ECB for the ECB_EXR1_WEB dataflow: |
|------------|---|---|
| 377        |   | http://ws-entry-point/data/ECB_EXR1_WEB/M.USD.EUR.SP00.A/ECB  |
| 378        |   | In this example, the assumption is made that the dataflow id (ECB_EXR1_WEB) is                          |
| 379        |   | sufficient to uniquely identify the dataflow, and the data provider id (ECB) is sufficient              |
| 380        |   | to uniquely identify the data provider.   |
| 381        | • | To retrieve the data, provided by the ECB for the ECB_EXR1_WEB dataflow, for the                        |
| 382        |   | supplied series keys, using wildcarding for the second dimension:                                       |
| 383        |   | http://ws-entry-point/data/ECB,ECB_EXR1_WEB,latest/MEUR.SP00.A/ECB                                      |
|            |   |   |
| 384        |   | In this example, the full reference to the dataflow is supplied (ECB as maintenance                     |
| 385        |   | agency, ECB_EXR1_WEB as dataflow id and latest for the version).  |
|            |   |   |
| 386        | • | To retrieve the updates and revisions for the data matching the supplied series keys,                   |
| 387        |   | using the OR operator for the second dimension, and using percent encoding for the                      |
| 388        |   | updatedAfterDate:   |
| 389        |   | http://ws-entry-  |
| 390        |   | point/Data/ECB_EXR1_WEB/M.USD+GBP+JPY.EUR.SP00.A?updatedAfter=2   |
| 391        |   | 009-05-15T14 %3A 15 %3A 00%2B01%3A00  |
|            |   |   |
| 392        | • | To retrieve the data matching the supplied series key and restricting the start and end                 |
| 393        |   | dates:  |
| 394        |   | http://ws-entry-  |
| 395        |   | point/data/ECB_EXR1_WEB/D.USD.EUR.SP00.A?startPeriod=2009-05-   |
| 396        |   | 01&endPeriod=2009-05-31   |
|            |   |   |

# 397 4.5 Schema queries

# **398 4.5.1 Resources**

399 The following resource is defined:

#### 400 • schema

401
402 This resource allows a client to ask a service to return an XML schema, which defines data
403 (or reference metadata) validity within a certain context. The service must take into account
404 the constraints that apply within that context (DSD or MSD, dataflow or metadataflow, or
405 provision agreement).

### 406 **4.5.2 Parameters**

# 407 **4.5.2.1 Parameters used for identifying a resource**

408 The following parameters are used for identifying resources:

| Parameter  | Туре  | Description  |
|------------|---|--|
| context    | One of the following:<br>datastructure,<br>metadatastructure, dataflow,<br>metadataflow or<br>provisionagreement. | The value of this parameter determines the constraints that need to be taken into account, when generating the schema. If datastructure or metadatastructure is used, constraints attached to the DSD or MSD must be applied when generating the schema. If dataflow or metadataflow is used, constraints attached to the dataflow or metadataflow and to the DSD or MSD used in the dataflow or metadataflow must be applied when generating the schema. If provisionagreement is used, constraints attached to the dataflow or metadataflow must be applied when generating the schema. If provisionagreement, as well as to the dataflow or metadataflow used in the dataflow or metadataflow or metadataflow used in the agreement and the DSD or MSD used in the dataflow or metadataflow or metadataflow must be applied when generating the schema. |
| agencyID   | A string compliant with the<br>SDMX<br>common:NCNameIDType  | The agency maintaining the artefact used to generate the schema to be returned.  |
| resourceID | A string compliant with the SDMX common: IDType   | The id of the artefact used to generate the schema to be returned.   |
| version    | A string compliant with the<br>SDMX<br>common:VersionType   | The version of the artefact used to generate the schema to be returned.  |

409 The parameters mentioned above are specified using the following syntax:

#### 410 protocol://ws-entry-point/schema/context/agencyID/resourceID/version

411 Furthermore, a keyword may be used<sup>20</sup>:

| Keyword | Scope | Description |
|---------|-------|-------------|
|---------|-------|-------------|

 $<sup>^{20}</sup>$  As the query for schema must match one artefact only, the keyword "all" is not supported for agencyId and resourceId.

|    | latest | version | Returns the latest version in production of the resource |
|----|--------|---------|--|
| 10 |        |         |  |

412

413 The following rules apply:

If no version attribute is specified, the version currently used in production should be returned. It is therefore equivalent to using the keyword "latest".

# 416 **4.5.2.2 Parameters used to further describe the desired results**

The following parameters are used to further describe the desired results, once the resourcehas been identified:

| Parameter              | Туре  | Description   |
|------------------------|---|---|
| dimensionAtObservation | A string<br>compliant with<br>the SDMX<br>common:<br>NCNameIDType | The ID of the dimension to be attached at the observation level.  |
| explicitMeasure        | Boolean   | For cross-sectional data validation,<br>indicates whether observations are strongly<br>typed (defaults to false). |

# 419 **4.5.3 Examples**

420

- 421 To retrieve the schema for data supplied within the context of version 1.0 of the provision
- 422 agreement EXR\_WEB maintained by the ECB:
- 423 <u>http://ws-entry-point/schema/provisionagreement/ECB/ EXR\_WEB/1.0/</u>
- In this case, the schema returned by the service must take into account the
- 425 constraints attached to the provision agreement, the dataflow used in the provision
- 426 agreement and the data structure definition used in the dataflow.

# 427 **4.6** Selection of the Appropriate Representation

- Selection of the appropriate formats for the response message is made using the
   mechanisms defined for HTTP Content Negotiation<sup>21</sup>. Using the HTTP Content Negotiation
   mechanism, the client specifies the desired format and version of the resource using the
   Accept HTTP header<sup>22</sup>.
- Along with official mime types (e.g.: text/html, application/xml, etc), the standard also defines
  a syntax allowing a service to define its own types. The SDMX Restful API makes use of this
  functionality and the syntax is as follows:

<sup>&</sup>lt;sup>21</sup> For additional information, please refer to http://www.w3.org/Protocols/rfc2616/rfc2616-sec12.html

<sup>&</sup>lt;sup>22</sup> For additional information, please refer to http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html

application/vnd.sdmx.[format]+xml;version=[version<sup>23</sup>], where [format] should be replaced with 435 the desired format (i.e. : genericdata, structurespecificdata, structure, etc) and [version] 436 437 should be replaced with one of the versions of the SDMX standard, starting with SDMX 2.1 438 (e.g.: 2.1, future SDMX versions, etc).

439 A few examples are listed below

| 440 | • | SDMX-ML Generic Data Format, version 2.1:                  |
|-----|---|--|
| 441 |   | application/vnd.sdmx.genericdata+xml;version=2.1           |
| 442 | • | SDMX-ML Structure Specific Data Format, version 2.1:       |
| 443 |   | application/vnd.sdmx.structurespecificdata+xml;version=2.1 |
| 444 | • | SDMX-ML Structure Format, version 2.1:                     |
| 445 |   | application/vnd.sdmx.structure+xml;version=2.1             |
| 446 |   |  |

447 In case the client does not specify the desired format and version of the response message, 448 or only specifies the generic application/xml format, the SDMX RESTful web service should 449 return:

- The most recent version, that the service supports, of the SDMX-ML Structure format 450 451 for structural metadata queries; The most recent version, that the service supports, of the SDMX-ML Generic Data 452 format for data queries; 453
- The most recent version, that the service supports, of the SDMX-ML Generic 454 • 455 Metadata format for metadata queries.
- 456

The list below indicates the valid formats for SDMX RESTful web services, compliant with 457 version 2.1 of the SDMX standard: 458

- 459 application/vnd.sdmx.genericdata+xml;version=2.1 460
  - application/vnd.sdmx.structurespecificdata+xml;version=2.1
- 461 application/vnd.sdmx.generictimeseriesdata+xml;version=2.1 •
- 462 application/vnd.sdmx.structurespecifictimeseriesdata+xml;version=2.1 •
- application/vnd.sdmx.genericmetadata+xml;version=2.1 463
- application/vnd.sdmx.structurespecificmetadata+xml:version=2.1 464 465
  - application/vnd.sdmx.structure+xml;version=2.1
- application/vnd.sdmx.schema+xml;version=2.1 466

#### 4.7 Enabling data compression 467

Compression should be enabled using the appropriate HTTP Header field (Accept-468 Encoding). 469

#### Standard Errors for SDMX Web Services 5 470

#### 5.1 Introduction 471

472 In SDMX-ML version 2.1 an error element has been implemented in all messages that would 473 normally be a response to a query, that is: Structure, MetadataStructure, GenericData, 474 DSDData and Metadata. In case of an error the error element will be added to the 475 structure:Structures | generic:GenericDataSet | message:DataSet |

<sup>&</sup>lt;sup>23</sup> For the time being, only version 2.1 is supported as version number.

- 476 genericmetadata:MetadataSet | metadatareport:MetadataSet element in the response
  477 message.
- The element belongs to Message schemas and use the StatusTextType from the Common schema file. In the end of this document is an extract from the schema files showing the error
- 480 element.

482 483

- 481 The error part of the XML message supports the 2 following use cases:
  - Any error which is detected before SDMX data is streamed to the client will be returned in the Error element defined in the SDMX message namespace.
- If the error occurs after some SDMX data has already been streamed to the client,
   the error information will be supplied via a "footer" element in the SDMX payload.

# 486 5.2 Error handling in REST Web Service

487 RESTful web services should indicate errors using the proper HTTP status code. In addition,
488 whenever appropriate, the error should also be returned using the error message offered
489 starting with version 2.1 of SDMX-ML.

# 490 **5.3 SOAP Web Service**

SOAP web services should indicate errors using the standard SOAP error mechanism, using
 the specific namespace created for this purpose. In addition, whenever appropriate<sup>24</sup>, the
 error should also be returned using the error message offered starting with version 2.1 of
 SDMX-ML.

- 495 In case of error, the following elements should be set in the SOAP Envelope:
- the <faultcode> element for the error number
- the <faultstring> element for the description
- 498
   498 the <faultactor> element for the webservice method with the url for the webservice prefixed
- The <detail> element is optional, and can be used by the service provider to provide any additional information deemed useful

# 502 **5.4 Error categories**

503 The numbering of error messages divides the three types of messages up, and provides for 504 web services to implement custom messages as well:

- 000 499: Client-caused "errors"
- 506 500 999: Server-caused "errors"
- 1000 and up: Custom Messages

# 508 5.5 Client-Caused Errors

# 509 **5.5.1 No results found – 100**

510 There is no difference between SOAP and REST webservices for this message. If the result

from the query is empty the webservice should return this message. This is a way to inform

<sup>512</sup> the client that the result is empty.

 $<sup>^{24}</sup>$  According to the SOAP version Framework 1.2, it is not possible to place both a <faultcode> element and return other information.

# 513 **5.5.2 Unauthorized – 110**

514 For use when authentication is needed but has failed or has not yet been provided.

# 515 **5.5.3 Response Too Large Due to Client Request 130**

516 The request results in a response that is larger than the client is willing or able to process. 517 The client has the possibility, using SDMX-ML query, to limit the size of the response returned 518 by the server. In case the response is larger than the limit set by the client, the server should 519 return this error code.

### 520 **5.5.4 Syntax error – 140**

- 521 This error code is used when:
- 522 SOAP: The supplied SDMX-ML Query message is invalid (XML validation fails)
- 523 REST: The query string doesn't comply with the SDMX RESTful interface.

#### 524 5.5.5 Semantic error – 150

525 A web service should return this error when a request is syntactically correct but fails a 526 semantic validation or violates agreed business rules.

# 527 5.6 Server-Caused Errors

#### 528 **5.6.1 Internal Server Error – 500**

529 The webservice should return this error code when none of the other error codes better 530 describes the reason for the failure of the service to provide a meaningful response.

# 531 **5.6.2 Not implemented – 501**

- 532 If the webservice has not yet implemented one of the methods defined in the API, then the 533 webservice should return this error.
- 534 Note: All SDMX web services should implement all the standard interfaces, even if their only 535 function is to return this error message. This eases interoperability between SDMX-compliant 536 web services and it also eases the development of generic SDMX web services clients.

# 537 5.6.3 Service unavailable – 503

538 If a web service is temporarily unavailable because of maintenance or for some other similar 539 reasons, then the webservice should return this error code.

# 540 **5.6.4 Response size exceeds service limit - 510**

- 541 The request results in a response that is larger than the server is willing or able to process.
- 542 In case the service offers the possibility to users to download the results of large queries at a 543 later stage (for instance, using asynchronous web services), the web service may choose to

544 indicate the (future) location of the file, as part of the error message. In SOAP, this can be 545 done using the error element <faultstring>.

# 546 **5.7** *Custom Errors – 1000+*

547 Web services can use codes 1000 and above for the transmission of service-specific error 548 messages. However, it should be understood that different services may use the same 549 numbers for different errors, so the documentation provided by the specific service should be 550 consulted when implementing this class of errors.

# 551 5.8 SDMX to HTTP Error Mapping

552 The following table maps the SDMX error codes with the HTTP status code for RESTful web 553 services and indicates how the errors should be returned in SOAP.

| SDMX error                                      | HTTP error usage in REST     | SOAP usage |
|---|------------------------------|------------|
| Client errors                                   |                              |            |
| 100 No results found                            | 404 Not found                | SOAP Fault |
| 110 Unauthorized                                | 401 Unauthorized             | SOAP Fault |
| 130 Response too large due to<br>client request | 413 Request entity too large | SOAP Fault |
| 140 Syntax error                                | 400 Bad syntax               | SOAP Fault |
| 150 Semantic error                              | 400 Bad syntax               | SOAP Fault |
| Server errors                                   |                              |            |
| 500 Internal Server error                       | 500 Internal server error    | SOAP Fault |
| 501 Not implemented                             | 501 Not implemented          | SOAP Fault |
| 503 Service unavailable                         | 503 Service unavailable      | SOAP Fault |
| 510 Response size exceeds service limit         | 413 Request entity too large | Payload    |
| 1000+   | 500 Internal server error    | SOAP Fault |

# 554 6 Annex: Examples

# 555 6.1 Sample Queries for a Web Services Client

# 556 6.1.1 Step 1: Browsing an SDMX data source, using a list of subject 557 matter domains

# 558 **6.1.1.1 Use case**

562

559 The web client offers the possibility to retrieve data by browsing a list of subject matter 560 domains. The client requests the version currently in production of the SDW\_ECON category 561 scheme, maintained by the ECB.

|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
|   |                  |              |               |           |             |             |                             |          |
| E Done  |                  |              |               |           |             |             | Second Second Second Second | anet .;  |

# 563 6.1.1.2 Request using the RESTful API

564 http://ws-entry-point/categoryscheme/ECB/SDW\_ECON?references=categorisation

Note: Using the references attribute with a value of "categorisation", the categorisations used
by the category scheme will also be returned and these will contain references to the
dataflows attached to the categories.

# 568 6.1.1.3 Request using the SOAP API

```
569 <query:CategorySchemeQuery referenceResolution="Shallow">
570 <query:References>
571 <query:Default/>
572 </query:References>
573 <query:CategorySchemeWhere>
```

```
574 <query:ID>SDW_ECON</query:ID>
575 <query:AgencyID>ECB</query:AgencyID>
576 </query:CategorySchemeWhere>
577 </query:CategorySchemeQuery>
578
```

579 Note: For the sake of clarity, the SOAP envelope has been omitted.

# 580 **6.1.1.4 Response**

An SDMX-ML Structure message containing the category schemes, as well as the
 categorisations with references to the dataflows will be returned. The structure of the SDMX ML Structure message will be as follow (root element, header and repeated elements omitted
 for the sake of clarity):

| 585 | <structure:structures></structure:structures>                         |
|-----|---|
| 586 | <pre><structure:categoryschemes></structure:categoryschemes></pre>    |
| 587 | <structure:categoryscheme></structure:categoryscheme>                 |
| 588 |   |
| 589 |   |
| 590 | <pre><structure:categorisations></structure:categorisations></pre>    |
| 591 | <structure:dataflowcategorisation></structure:dataflowcategorisation> |
| 592 |   |
| 593 |   |
| 594 |   |
|     |   |

# 595 6.1.2 STEP 2: Selecting a dataflow

# 596 **6.1.2.1 Use case**

597 Once a subject-matter domain and a dataflow have been selected, a filter box needs to be 598 populated, to allow users to select data. In order to only create queries for data that actually 599 exist in the database, the dataflow constraints will also be requested.

#### 6.1.2.2 Request using the RESTful API 601

In this sample query, the dataflow id is 123456, the agency id is ECB and the version is 1.2. 602 Using the references attribute, the data structure definition and the constraints will also be 603 604 returned.

605 http://ws-entry-point/dataflow/ECB/123456/1.2?references=all

#### 6.1.2.3 Request using the SOAP API 606

<query:DataflowQuery> 607

600

If, before selecting data, the user wants to review the data structure definition used by the

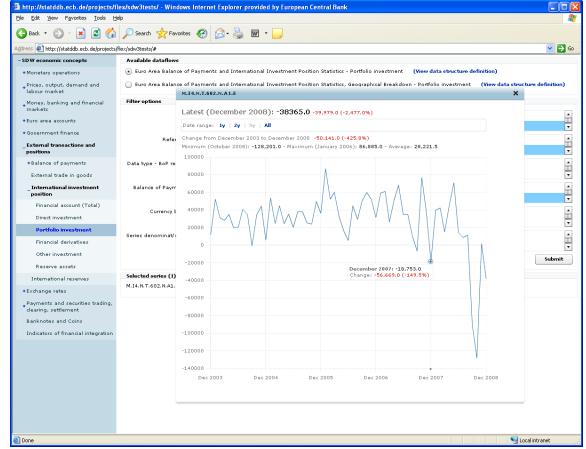

# 642 6.1.3 STEP 3: Data selection

# 643 **6.1.3.1 Use case**

The user uses the dimension filters, to retrieve the data he is interested in.

645

# 646 6.1.3.2 Request using the RESTful API

647 http://ws-entry-point/data/123456/M.I4.N.9.339+340+341.N.A1.A/ECB?startPeriod=2009-648 01&endPeriod=2009-12&detail=dataonly

Note: Apart from the dataflow id (123456), the data provider is set to ECB, and the series key 649 uses the OR operator for the 5<sup>th</sup> dimension. Furthermore, only data for 2009 should be 650 returned. As the purpose of the returned data is to be displayed on a graph, the detail level is 651 652 set to data only. Therefore, attributes and groups will be excluded from the returned message. 653 Regarding the references to the dataflow, the short form is used, as, for this particular web service, the dataflow id and the data provider id are sufficient to uniquely identify the dataflow 654 655 and the data provider respectively. Should this not be the case, the full reference must be 656 supplied (for example, ECB+123456+1.2 instead of 123456).

# 729 **6.1.3.4 Response**

730 An SDMX-ML Generic data message containing the requested time series.

The structure of the SDMX-ML Data message will be as follows (root element and headeromitted):

733 <message:DataSet>
734 <generic:Series>
735 </generic:Series>
736 </message:DataSet>

# 737 6.2 Sample Error Element in an SDMX message

```
738
     <xs:element name="Error" type="ErrorType">
739
          <xs:annotation>
                <xs:documentation>Error is used to communicate
740
741
               that an error has occurred when responding to a
               request in an non-registry environment. The
742
743
               content will be a collection of error messages.
744
                </xs:documentation>
745
          </xs:annotation>
     </xs:element>
746
747
     <xs:complexType name="ErrorType">
748
          <xs:annotation>
749
                <xs:documentation>ErrorType describes the
               structure of an error response.
750
                </xs:documentation>
751
752
          </xs:annotation>
753
          <xs:sequence>
                <xs:element name="ErrorMessage"</pre>
754
755
          type="common:StatusTextType" maxOccurs="unbounded">
756
                     <xs:annotation>
757
                          <xs:documentation>ErrorMessage
758
                          contains the error message. It can
```

| 759 | occur multiple times to communicate   |
|-----|---------------------------------------|
| 760 | message for multiple errors, or to    |
| 761 | communicate the error message in      |
| 762 | parallel languages. If both messages  |
| 763 | for multiple errors and parallel      |
| 764 | language messages are used, then each |
| 765 | error message should be given a code  |
| 766 | in order to distinguish message for   |
| 767 | unique errors.                        |
| 768 |                                       |
| 769 |                                       |
| 770 |                                       |

#### **Annex: Security guidelines** 7 804

This annex describes useful security measures for SDMX web services<sup>25</sup>. 805

#### 7.1 Authentication 806

Authentication refers to the process of uniquely identifying an entity. In the context of a web 807 808 service, service authentication and client authentication are distinct.

#### 7.1.1 Server authentication 809

810 Clients of web services have a high interest in ensuring that they are connected to the service 811

they intend to consume and not to a rogue service masquerading as a trusted entity. To support this, use SSL/TLS<sup>26</sup> and offer clients the possibility to consume the web service over 812 HTTPS.

813

#### 7.1.2 Client authentication 814

815 When restrictions apply to the data and metadata published, it is important for the service provider to be able to uniquely identify the client. 816

817 For RESTful web services, support this requirement by using HTTP basic authentication over SSL/TLS<sup>27</sup>. If stronger authentication is required, use SSL client certificates instead. 818

HTTP basic authentication over SSL/TLS can also be used to support authentication in SOAP 819 web services. In situations where this is not appropriate, use industry standard such as 820 OASIS Web Services Security (WSS) Specification. Use and declare a standard token profile 821 822 in WS-Policy assertions. Include and explicitly declare WS Security assertions and 823 requirements the WSDL file with a standard targeted namespace and security token 824 information.

#### 7.2 Confidentiality 825

Confidentiality refers to the process of guaranteeing that resources cannot be accessed by 826 unauthorised users. 827

828 This requirement is a key requirement for the SDMX web services when restrictions apply to the data and metadata published, as both clients and services have a high interest in 829 ensuring their data is not illegally accessed. For these web services, use SSL/TLS<sup>28</sup> to 830

support confidentiality during the transfer between the service and the client using. 831

#### 7.3 Integrity 832

833 Integrity refers to the process of guaranteeing that resources cannot be accidentally or 834 maliciously modified.

<sup>27</sup> See RFC 2617 for additional information.

<sup>&</sup>lt;sup>25</sup> This annex is not comprehensive, as security-related measures for SDMX web services will vary according to the scope of the web service and the security policies of the organisation maintaining the web service.

<sup>&</sup>lt;sup>26</sup> This allows the client to validate that the certificate matches the domain name of the service, is issued by a trusted authority, and is not expired.

<sup>&</sup>lt;sup>28</sup> SSL/TLS supports this requirement using a combination of symmetric and asymmetric encryption.

835 Support this requirement using SSL/TLS<sup>29</sup>.

<sup>&</sup>lt;sup>29</sup> SSL/TLS supports this requirement by calculating a message digest.
