## 1 Introduction

Web services represent the current generation of Internet technologies. They allow computer applications to exchange data directly over the Internet, essentially allowing modular or distributed computing in a more flexible fashion than ever before. In order to allow web services to function, however, many standards are required: for requesting and supplying data; for expressing the enveloping data which is used to package exchanged data; for describing web services to one another, to allow for easy integration into applications that use other web services as data resources.

SDMX, with its focus on the exchange of data using Internet technologies provides some of these standards relating to statistical data and metadata. Many web-services standards already exist, however, and there is no need to re-invent them for use specifically within the statistical community. Specifically, SOAP (which originally stood for the “Simple Object Access Protocol”) and the Web Services Description Language (WSDL) can be used by SDMX to complement the data and metadata exchange formats they are standardizing. In the web services world, the REST (“Representational State Transfer”) protocol is also often used, relying on a URL-based syntax to invoke web services. Such REST-based services can be described in a standard fashion using WADL (“Web Application Description Language”), in the same way that XML-invoked web services based on SOAP can be described using WSDL.

Despite the promise of SOAP and WSDL, it became evident from early implementations by vendors that these were not, in fact, interoperable. It was for this reason that the Web Services - Interoperability (WS-I) initiative was started. This consists of a group of vendors who have all implemented the same web-services standards the same way, and have verified this fact by doing interoperability tests. They publish profiles describing how to use web services standards interoperably. SDMX uses the work of WS-I as appropriate to meet the needs of the statistical community.

This document provides several SDMX-specific guidelines for using the existing standards in a fashion which will promote interoperability among SDMX web services, and allow for the creation of generic client applications which will be able to communicate meaningfully with any SDMX web service which implements these guidelines.

Much of the content of this document is not normative – instead the intention is to suggest a best practice in using SDMX-ML documents and web services standards for the exchange of statistical data and metadata. However, the SDMX WSDL and WADL files that formalise, in XML, the APIs described in this document are normative.

## 2 Web Services and SDMX-ML

Conventional applications and services traditionally expose their functionality through application programming interfaces (APIs). Web services are no different – they provide a public version of the function calls which can be accessed over the web using web-services protocols (SOAP or REST). In order to make a set of web services interoperate, it is necessary to have a standard abstraction, or model, on which these public functions are based. SDMX benefits from having a common information model, and it is a natural extension to use the SDMX Information Model as the basis for standard web-services function calls.

Web services exchange data in an XML format: this is how the data passed between web services is formatted. SDMX-ML, as a standard XML for exchanging data and structural metadata within the statistical realm, provides a useful XML format for the public serialization of web-services data. While there are some techniques for simple web-services data

48 exchanges – remote procedure calls (RPCs) – which are often used, the use of a set of XML  
49 exchanges based on a common information model is seen as a better approach for achieving  
50 interoperability.

51 There are several different document types available within SDMX-ML, and all are  
52 potentially important to the creators and users of SDMX web services.

- 53
- 54 1. **The "Structure" Message:** This message describes the concepts, data and  
55 metadata structure definitions, and code lists which define the structure of  
56 statistical data and reference metadata. Every SDMX-compliant data set or  
57 metadata set must have a data or metadata structure definition described for it.  
58 This XML description must be available from an SDMX web service when it is  
59 asked for.
  - 60 2. **The "Generic" Data Message:** This is the "generic" way of marking up an SDMX  
61 data set. This schema describes a non-data-structure-definition-specific format  
62 for exchanging SDMX data, and it is a requirement that every SDMX data web  
63 service makes its data available in at least this form. It is expected that, in many  
64 instances, other data-structure-definition-specific XML forms for expressing data  
65 will also be supported in parallel services.
  - 66 3. **The "Structure Specific" Data Message:** This is a standard schema format  
67 derived from the structure description using a standardized mapping, and many  
68 standard tags. It is specific to the structure of a particular data structure definition,  
69 and so every data structure definition will have its own "structure specific"  
70 schemas. It is designed to enable the exchange of large data sets, This is a data  
71 format that a web service may wish to provide, depending on the requirements of  
72 the data they exchange.
  - 73 4. **The "Query" Messages:** This is the set of messages used to invoke SOAP-  
74 based SDMX web services. These messages all conform in a consistent way to a  
75 master template, but are decomposed into specific queries to allow each service  
76 to support only those fields in the template message which are meaningful to it.  
77 These query messages are generic across all data and metadata structure  
78 definitions, making queries in terms of the values specified for the concepts of a  
79 specific structure (as specified in a structure description). It allows users to query  
80 for data, concepts, code lists, data and metadata structure definitions.
  - 81 5. **The "RegistryInterfaces" Message:** All of the Registry Interfaces are sub-  
82 elements of this SDMX-ML Message type. They are more fully described in the  
83 SDMX Registry Specification.
  - 84 6. **The "Generic" Metadata Message:** This is a message used to report reference  
85 metadata concepts, which is generic across all types of reference metadata  
86 structural descriptions.
  - 87 7. **The "Structure Specific" Metadata Message:** This is a message used to report  
88 reference metadata concepts specific to a particular metadata structure definition.

## 89 **3 SOAP-Based SDMX Web Services: WSDL** 90 **Operations and Behaviours**

### 91 **3.1 Introduction**

92 This section addresses the operations and behaviours specific to SOAP-based Web Services.  
93 Most important is a list of standard WSDL operations, which will form the basis of, and be  
94 accompanied by, actual standard WSDL XML instances, for use in development packages.  
95 There are also several guidelines for the implementation of web services, to support  
96 interoperability.

97 All SDMX SOAP web services should be described using WSDL instances. The global  
98 element for each XML data and metadata format within SDMX should be specified as the  
99 content of the replies to each exchange. The function names for each identified pattern are  
100 specified below, along with the type of SDMX-ML payload.

101 Because SOAP RPC is not supported, the “parameters” of each function are simply an  
102 instance of the appropriate SDMX-ML message type. As noted above, <wsdl:import> should  
103 be used to specify the schema for a multiple-message exchange. The distributed WSDL files  
104 illustrate how SOAP messages should be used.

105 The bindings included in the distributed WSDL files are according to SOAP 1.1.

### 106 **3.2 The SDMX Web-Services Namespace**

107 The SDMX Web Services namespace<sup>1</sup> contains a set of messages specific to the use of  
108 SOAP-based services. Each of the operations described will have a message to invoke the  
109 Web-Service, and a response message. In each case, these are refinements of other SDMX  
110 messages, appropriate to the operation being performed – these are described in the list of  
111 operations, below.

112 Additionally, there is a list of error codes to be used in the SOAP envelope (see the [standard](#)  
113 [error codes section](#)).

### 114 **3.3 Support for WSDL Operations**

115 An SDMX web service must support all of the listed operations, even if the support is minimal,  
116 and only involves the generation of an error explaining that the requested operation has not  
117 been implemented. This is necessary for the sake of interoperability.

### 118 **3.4 List of WSDL Operations**

119 For the use of SOAP and WSDL, the Web Services Interoperability specification version 1.1  
120 should be followed.

---

<sup>1</sup> i.e., the declared namespace of the SDMX WSDL definition.

121 **3.4.1 Data**

122 **3.4.1.1 GetStructureSpecificData**

123 This operation is invoked using a GetStructureSpecificDataRequest message, and receives a  
124 GetStructureSpecificDataResponse as a reply.

125 **3.4.1.2 GetGenericData**

126 This operation is invoked using a GetGenericDataRequest message, and receives a  
127 GetGenericDataResponse as a reply.

128 **3.4.1.3 GetStructureSpecificTimeSeriesData**

129 This operation is invoked using a GetStructureSpecificTimeSeriesDataRequest message, and  
130 receives a GetStructureSpecificTimeSeriesDataResponse as a reply.

131 **3.4.1.4 GetGenericTimeSeriesData**

132 This operation is invoked using a GetGenericTimeSeriesDataRequest message, and receives  
133 a GetGenericTimeSeriesDataResponse as a reply.

134 **3.4.2 Metadata**

135 **3.4.2.1 GetGenericMetadata**

136 This operation is invoked using a GetGenericMetadataRequest message, and receives a  
137 GetGenericMetadataResponse as a reply.

138 **3.4.2.2 GetStructureSpecificMetadata**

139 This operation is invoked using a GetStructureSpecificRequest message, and receives a  
140 GetStructureSpecificResponse as a reply.

141 **3.4.3 Structure usage**

142 **3.4.3.1 GetDataflow**

143 This operation is invoked using a GetDataflowRequest message, and receives a  
144 GetDataflowResponse as a reply.

145 **3.4.3.2 GetMetadataflow**

146 This operation is invoked using a GetMetadataflowRequest message, and receives a  
147 GetMetadataflowResponse as a reply.

148 **3.4.4 Structure**

149 **3.4.4.1 GetDataStructure**

150 This operation is invoked using a GetDataStructureRequest message, and receives a  
151 GetDataStructureResponse as a reply.

152 **3.4.4.2 GetMetadataStructure**

153 This operation is invoked using a GetMetadataStructureRequest message, and receives a  
154 GetMetadataStructureResponse as a reply.

155 **3.4.5 Item scheme**

156 **3.4.5.1 GetCategoryScheme**

157 This operation is invoked using a GetCategorySchemeRequest message, and receives a  
158 GetCategorySchemeResponse as a reply.

159 **3.4.5.2 GetConceptScheme**

160 This operation is invoked using a GetConceptSchemeRequest message, and receives a  
161 GetConceptSchemeResponse as a reply.

162 **3.4.5.3 GetCodelist**

163 This operation is invoked using a GetCodelistRequest message, and receives a  
164 GetCodelistResponse as a reply.

165 **3.4.5.4 GetHierarchicalCodelist**

166 This operation is invoked using a GetHierarchicalCodelistRequest message, and receives a  
167 GetHierarchicalCodelistResponse as a reply.

168 **3.4.5.5 GetOrganisationScheme**

169 This operation is invoked using a GetOrganisationsSchemeRequest message, and receives a  
170 GetOrganisationSchemeResponse as a reply.

171 **3.4.5.6 GetReportingTaxonomy**

172 This operation is invoked using a GetReportingTaxonomyRequest message, and receives a  
173 GetReportingTaxonomyResponse as a reply.

174 **3.4.6 Other maintainable artefacts**

175 **3.4.6.1 GetStructureSet**

176 This operation is invoked using a GetStructureSetRequest message, and receives a  
177 GetStructureSetResponse as a reply.

178 **3.4.6.2 GetProcess**

179 This operation is invoked using a GetProcessRequest message, and receives a  
180 GetProcessResponse as a reply.

181 **3.4.6.3 GetCategorisation**

182 This operation is invoked using a GetCategorisationRequest message, and receives a  
183 GetCategorisationResponse as a reply.

184 **3.4.6.4 GetProvisionAgreement**

185 This operation is invoked using a GetProvisionAgreementRequest message, and receives a  
186 GetProvisionAgreementResponse as a reply.

187 **3.4.6.5 GetConstraint**

188 This operation is invoked using a GetConstraintRequest message, and receives a  
189 GetConstraintResponse as a reply.

190 **3.4.7 XML Schemas (XSD)**

191 **3.4.7.1 GetDataSchema**

192 This operation is invoked using a GetDataSchemaRequest message, and receives a  
193 GetDataSchemaResponse as a reply.

194 **3.4.7.2 GetMetadataSchema**

195 This operation is invoked using a GetMetadataSchemaRequest message, and  
196 receives a GetMetadataSchemaResponse as a reply.

197 **3.4.8 Generic query for structural metadata**

198 **3.4.8.1 GetStructures**

199 This operation is invoked using a GetStructuresRequest message, and receives a  
200 GetStructuresResponse as a reply.

201

202 **3.5 Other Behaviours**

203 **3.5.1 Versioning Defaults**

204 When no version is specified in the message invoking a service, the default is to return the  
205 last production version of the resource(s) requested.

206 **3.5.2 Resolving References and Specifying Returned Objects**

207 Version 2.1 of the SDMX-ML Query message offers new functionality to resolve reference  
208 and specify the type of objects to be returned. The SOAP API relies on this mechanism for

209 resolving references and specifying returned objects. See Section “[Applicability and meaning](#)  
210 [of references attribute](#)”.

### 211 **3.5.3 Enabling compression**

212 Compression should be enabled using the appropriate HTTP Header field (Accept-Encoding).

### 213 **3.5.4 Implementation of the SOAP based SDMX Web Services**

214 In the SDMX Web Services, the development is Contract-First since the WSDL has been  
215 specified by the standard. Furthermore it is a Web Service of already prepared XML  
216 messages requests/responses, i.e. the interfaces for the application logic are the XML  
217 messages. Therefore there is no need to generate stubs for serialisation and de-serialisation  
218 of the SOAP payloads from/to the native language classes. The indicative way is to have full  
219 control on the XML messages requests/responses. When using the automatic generation of  
220 code it will include an extra element for the parameter of the operation in the SOAP request  
221 according to the RPC paradigm, and to the SOAP specifications that is not desired according  
222 to the standardised SDMX WSDL.

223 When using Apache Axis in Java, an interface for the service is offered by the toolkit that  
224 reads/returns the XML payloads using DOM elements (`DOMElement` in Axis2). Moreover  
225 when using the Java API for XML Web Services (JAX-WS), the developer can use  
226 the `Provider<SOAPMessage>` interface, where he is responsible for creating the SOAP  
227 request and response messages as well as specifying the standardised WSDL of the service.

228 However in the .NET environment there is no similar solution for this. The developer of the  
229 service will have to use the `XmlAnyElement` parameter for the .NET web methods. This  
230 specifies that the parameter of the Service method can be any XML element thus allows the  
231 developer to take control of the XML payload. The details of this approach are presented in  
232 the “Annex I: How to eliminate extra element in the .NET SDMX Web Service” in the section  
233 06 of the SDMX documentation.

### 234 **3.5.5 Compliance with WS-I**

235 To ensure interoperability between SDMX web services, compliance with sections of the WS-I  
236 Profile 1.1 is recommended for all SDMX web services. The documentation can be found  
237 at <http://www.ws-i.org/Profiles/BasicProfile-1.1-2004-08-24.html>. The recommended sections  
238 are those concerning the use of SOAP and WSDL. UDDI, while useful for advertising the  
239 existence of SDMX web services, is not necessarily central to SDMX interoperability.

## 240 **4 SDMX RESTful API**

### 241 **4.1 A Brief Introduction to REST**

242 This SDMX API is based on the REST principles, as described below:

- 243
- 244 • In REST, specific information is known as “**Resource**”. In SDMX, specific resources  
245 would be, for example, code lists, concept schemes, data structure definitions,  
246 dataflows, etc. Each resource is addressable via a **global identifier** (i.e.: a URI).
  - 247 • Manipulating resources is done using **methods defined in the HTTP protocol** (e.g.:  
248 GET, POST, PUT, DELETE). This API focuses on data retrieval, and, therefore, only  
the usage of HTTP GET is covered in this document.

- 249       • A resource can be represented in various formats (such as the different flavours and  
250 versions of the SDMX-ML standard). Selection of the appropriate **representation** is  
251 done using HTTP Content Negotiation and the HTTP Accept request header.

## 252 **4.2 Scope of the API**

253 The RESTful API focuses on simplicity. The aim is not to replicate the full semantic richness  
254 of the SDMX-ML Query message but to make it simple to perform a limited set of standard  
255 queries. Also, in contrast to other parts of the SDMX specification, the RESTful API focuses  
256 solely on data retrieval (via HTTP GET). More specifically, the API allows:

- 257       • To retrieve structural metadata, using a combination of id, agencyID and version  
258 number.
- 259       • To retrieve statistical data or reference metadata using keys (with options for  
260 wildcarding and support for the OR operator), data or metadata flows and data or  
261 metadata providers.
- 262       • To further refine queries for statistical data or reference metadata using time  
263 information (start period and end period).
- 264       • To retrieve updates and revisions only.
- 265       • To return the results of a query in various formats. The desired format and version of  
266 the returned message will be specified using HTTP Content Negotiation (and the  
267 HTTP Accept request header).
- 268       • For structural metadata, it is possible to instruct the web service to resolve references  
269 (for instance, when querying for data structure definitions, it is possible to also  
270 retrieve the concepts and code lists used in the returned data structure definitions),  
271 as well as artefacts that use the matching artefact (for example, to retrieve the  
272 dataflows that use a matching data structure definition).
- 273       • For structural metadata, it is possible to retrieve a minimal version of the artefact, for  
274 the sake of efficiency (for example, to retrieve all code lists – names, ids, etc –  
275 without the codes).
- 276       • A distinction should be established between the elements that allow identifying the  
277 resource to be retrieved and the elements that give additional information about, or  
278 allow to further filter, the desired results. Elements belonging to the 1<sup>st</sup> category are  
279 specified in the path part of the URL while elements belonging to the 2<sup>nd</sup> category are  
280 specified in the query string part of the URL.

## 281 **4.3 Structural Metadata Queries**

### 282 **4.3.1 Resources**

283 The following resources are defined:

- 284       • `datastructure`<sup>2</sup>
- 285       • `metadatastructure`<sup>3</sup>
- 286       • `categoriescheme`
- 287       • `conceptscheme`
- 288       • `codelist`
- 289       • `hierarchicalcodelist`
- 290       • `organisationscheme`<sup>4</sup>
- 291       • `agencyscheme`<sup>5</sup>

---

<sup>2</sup> This has been shortened from `DataStructureDefinition` to allow for shorter URLs.

<sup>3</sup> This has been shortened from `MetadataStructureDefinition` to allow for shorter URLs.

<sup>4</sup> The `organisationscheme` resource can be used whenever the role played by the organisation schemes (e.g. maintenance agencies) is not known/relevant.

- 292 • dataproviderscheme
- 293 • dataconsumerscheme
- 294 • organisationunitscheme
- 295 • dataflow
- 296 • metadataflow
- 297 • reportingtaxonomy
- 298 • provisionagreement
- 299 • structureset
- 300 • process
- 301 • categorisation
- 302 • contentconstraint
- 303 • attachmentconstraint
- 304 • structure<sup>6</sup>

## 305 4.3.2 Parameters

### 306 4.3.2.1 Parameters used for identifying a resource

307 The following parameters are used for identifying resources:

Parameter	Type	Description
agencyID	A string compliant with the SDMX common:NCNameIDType	The agency maintaining the artefact to be returned
resourceID	A string compliant with the SDMX common:IDType	The id of the artefact to be returned
version	A string compliant with the SDMX common:VersionType	The version of the artefact to be returned

308 The parameters mentioned above are specified using the following syntax:

309 protocol://ws-entry-point/resource/agencyID/resourceID/version

310 Furthermore, some keywords may be used:

Keyword	Scope	Description
all <sup>7</sup>	agencyID	Returns artefacts maintained by any maintenance agency
all	resourceID	Returns all resources of the type defined by the resource parameter <sup>8</sup>

<sup>5</sup> For 3 of the subtypes of OrganisationScheme (AgencyScheme, DataProviderScheme and DataConsumerScheme), the id and version parameters have fixed values. See Section 03 of the SDMX information model document for additional information.

<sup>6</sup> This type can be used to retrieve any type of structural metadata matching the supplied parameters.

<sup>7</sup> As “all” is a reserved keyword in the SDMX RESTful API, it is recommended not to use it as an identifier for agencies, resources or a specific version.

<sup>8</sup> Default, if parameter not specified

all	version	Returns all versions of the resource
latest	version	Returns the latest version in production of the resource

311

312 The following rules apply:

- 313
- 314
- 315
- 316
- 317
- 318
- 319
- 320
- 321
- If no version is specified, the version currently used in production should be returned. It is therefore equivalent to using the keyword “latest”.
  - If no agencyID is specified, the matching artefacts maintained by any maintenance agency should be returned. It is therefore equivalent to using the keyword “all”<sup>9</sup>.
  - If no resourceID is specified, all matching artefacts (according to the other criteria used) should be returned. It’s is therefore equivalent to using the keyword “all”.
  - If no parameters are specified, the “latest” version of “all” resources of the type identified by the resource parameter, maintained by any maintenance agency should be returned.

#### 322 4.3.2.2 Parameters used to further describe the desired results

323 The following parameters are used to further describe the desired results, once the resource  
324 has been identified. As mentioned in [3.2](#), these parameters appear in the query string part of  
325 the URL.

Parameter	Type	Description	Default
detail	String	This attribute specifies the desired amount of information to be returned. For example, it is possible to instruct the web service to return only basic information about the maintainable artefact (i.e.: id, agency id, version and name). Most notably, items of item schemes will not be returned (for example, it will not return the codes in a code list query). Possible values are: “allstubs” (all artefacts should be returned as stubs <sup>10</sup> ), “referencestubs” (referenced artefacts should be returned as stubs <sup>11</sup> ) and full (all available information for all artefacts should be returned <sup>12</sup> ) <sup>13</sup> .	full
references	String	This attribute instructs the web service to return (or not) the artefacts referenced by the artefact to be returned (for example, the code lists and concepts used by the data structure definition matching the query), as	none

<sup>9</sup> This would potentially return more than one artefact, if different agencies give the same identifier to a resource (for example, [http://ws-entry-point/codelist/all/CL\\_FREQ](http://ws-entry-point/codelist/all/CL_FREQ), could return more than one codelist if more than one agency is maintaining a codelist with id “CL\_FREQ”).

<sup>10</sup> The equivalent in SDMX-ML query is: Stub at the query level and Stub at the reference level.

<sup>11</sup> The equivalent in SDMX-ML query is: Full at the query level and Stub at the reference level.

<sup>12</sup> The equivalent in SDMX-ML query is: Full at the query level and Full at the reference level.

<sup>13</sup> In case a stub is returned, the isExternalReference attribute of the returned artefact(s) should be set to “true” and the location where the full version of the artefact(s) can be downloaded should be specified in the structureURL attribute.

		<p>well as the artefacts that use the matching artefact (for example, the dataflows that use the data structure definition matching the query). Possible values are: “none” (no references will be returned), “parents” (the artefacts that use the artefact matching the query), “parentsandsiblings” (the artefacts that use the artefact matching the query, as well as the artefacts referenced by these artefacts), “children” (artefacts referenced by the artefact to be returned), “descendants” (references of references, up to any level, will also be returned), “all” (the combination of parentsandsiblings and descendants). In addition, a concrete type of resource, as defined in <a href="#">3.3.1</a>, may also be used (for example, references=codelist).</p>	
--	--	---	--

326 **4.3.2.3 Applicability and meaning of references attribute**

327 The table below lists the 1<sup>st</sup> level artefacts (one level up, one level down) that will be returned  
 328 if the references parameter is set to “all”. Artefacts referenced by the matching artefact are  
 329 displayed in regular style, while the artefacts that reference the matching artefact are  
 330 displayed in *Italic*.

<b>Maintainable artefact</b>	<b>Artefacts returned</b>

### 331 4.3.3 Examples

332

333 - To retrieve version 1.0 of the DSD with id ECB\_EXR1 maintained by the ECB, as well as the  
334 code lists and the concepts used in the DSD:

335 [http://ws-entry-point/datastructure/ECB/ECB\\_EXR1/1.0?references=children](http://ws-entry-point/datastructure/ECB/ECB_EXR1/1.0?references=children)

336 - To retrieve the latest version in production of the DSD with id ECB\_EXR1 maintained by the  
337 ECB, without the code lists and concepts of the DSD:

338 [http://ws-entry-point/datastructure/ECB/ECB\\_EXR1](http://ws-entry-point/datastructure/ECB/ECB_EXR1)

339 - To retrieve all DSDs maintained by the ECB, as well as the dataflows using these  
340 DSDs:

341 <http://ws-entry-point/datastructure/ECB?references=dataflow>

342 - To retrieve the latest version in production of all code lists maintained by all maintenance  
343 agencies, but without the codes:

344 <http://ws-entry-point/codelist?detail=allstubs>

345 - To retrieve, as stubs, the latest version in production of all maintainable artefacts maintained  
346 by the ECB:

347 <http://ws-entry-point/structure/ECB?detail=allstubs>

348

## 349 **4.4 Data and Metadata Queries**

### 350 **4.4.1 Resources**

351 The following resources should be supported:

- 352     • data  
353     • metadata

### 354 **4.4.2 Parameters**

#### 355 **4.4.2.1 Parameters used for identifying a resource**

356 The following parameters are used for identifying resources in data queries:

Parameter	Type	Description
flowRef <sup>14</sup>	<p>A string identifying the dataflow. The syntax is agency id, artefact id, version, separated by a “,”. For example: AGENCY_ID,FLOW_ID,VERSION</p> <p>In case the string only contains one out of these 3 elements, it is considered to be the flow id, i.e. all,FLOW_ID,latest</p> <p>In case the string only contains two out of these 3 elements, they are considered to be the agency id and the flow id, i.e. AGENCY_ID,FLOW_ID,latest</p>	The data (or metadata) flow of the data (or metadata) to be returned
key	A string compliant with the KeyType defined in the SDMX WADL.	The key of the artefact to be returned. Wildcarding is supported by omitting the dimension code for the dimension to be wildcarded. For example, if the following series key identifies the bilateral exchange rates for the daily US dollar exchange rate against the euro, D.USD.EUR.SP00.A, then the following series key can be used to retrieve the data for all currencies against the euro: D..EUR.SP00.A. The OR operator is supported using the + character. For example, the following series key can be used to retrieve the exchange rates against the euro for both the US dollar and the Japanese Yen:

<sup>14</sup> It's a common use case in SDMX-based web services that the flow id is sufficient to uniquely identify a dataflow. Should this not be the case, the agency id and the dataflow version, can be used, in conjunction with the flow id, in order to uniquely identify a dataflow.

		D.USD+JPY.EUR.SP00.A.
providerRef <sup>15</sup>	<p>A string identifying the provider. The syntax is agency id, provider id, separated by a “,”. For example: AGENCY_ID,PROVIDER_ID.</p> <p>In case the string only contains one out of these 2 elements, it is considered to be the provider id, i.e. all,PROVIDER_ID.</p>	The provider of the data (or metadata) to be retrieved. If not supplied, the returned message will contain data (or metadata) provided by any provider.

357

358 The parameters mentioned above are specified using the following syntax:

359 protocol://ws-entry-point/resource/flowRef/key/providerRef

360 Furthermore, some keywords may be used:

Keyword	Scope	Description
all	key	Returns all data belonging to the specified dataflow and provided by the specified provider.
all <sup>16</sup>	providerRef	Returns all data matching the supplied key and belonging to the specified dataflow that has been provided by any data provider.

361

362 The following rules apply:

- 363 • If no key is specified, all data (or metadata) belonging to the dataflow (or  
364 metadataflow) identified by the flowRef should be supplied. It is therefore equivalent  
365 to using the keyword “all”.
- 366 • If no providerRef is specified, the matching data (or metadata) provided by any data  
367 provider should be returned. It is therefore equivalent to using the keyword “all”.

#### 368 4.4.2.2 Parameters used to further filter the desired results

369 The following parameters are used to further describe (or filter) the desired results, once the  
370 resource has been identified. As mentioned in [3.2](#), these parameters go in the query string  
371 part of the URL.

Parameter	Type	Description
startPeriod	common:StandardTimePeriodType, as defined in the	The start period for which results should be supplied

<sup>15</sup> It’s a common use case in SDMX-based web services that the provider id is sufficient to uniquely identify a data provider. Should this not be the case, the agency can be used, in conjunction with the provider id, in order to uniquely identify a data provider.

<sup>16</sup> As “all” is a reserved keyword in the SDMX RESTful API, it is recommended not to use it as an identifier for providers.

	<p>SDMXCommon.xsd schema.</p> <p>Can be expressed using<sup>17</sup>:</p> <ul style="list-style-type: none"> <li>• dateTime: all data that falls between the calendar dates will be matched</li> <li>• Gregorian Period: all data that falls between the calendar dates will be matched</li> <li>• Reporting Period: all data reported as periods that fall between the specified periods will be returned. When comparing reporting weeks and days to higher order periods (e.g. quarters) one must account for the actual time frames covered by the periods to determine whether the data should be included. Data reported as Gregorian periods or distinct ranges will be returned if it falls between the specified reporting periods, based on a reporting year start day of January 1.</li> </ul> <p>In case the : or + characters are used, the parameter must be percent-encoded by the client<sup>18</sup>.</p> <p>Note that this value is assumed to be inclusive to the range of data being sought.</p>	(inclusive).
endPeriod	Same as above	The end period for which results should be supplied (inclusive).
updatedAfter	xs:dateTime	The last time the query was performed by the client in the database. If this attribute is used, the returned message should only include the latest

<sup>17</sup> For additional information, see section 4.2.14 of Section 06 (SDMX Technical Notes).

<sup>18</sup> See [http://en.wikipedia.org/wiki/URL\\_encoding#Percent-encoding\\_reserved\\_characters](http://en.wikipedia.org/wiki/URL_encoding#Percent-encoding_reserved_characters) for additional information.

		<p>version of what has changed in the database since that point in time (updates and revisions). This should include:</p> <ul style="list-style-type: none"> <li>- Observations<sup>19</sup> that have been added since the last time the query was performed (INSERT).</li> <li>- Observations that have been revised since the last time the query was performed (UPDATE).</li> <li>- Observations that have been deleted since the last time the query was performed (DELETE).</li> </ul> <p>If no offset is specified, default to local time of the web service.</p>
firstNObservations	Positive integer	Integer specifying the maximum number of observations to be returned for each of the matching series, starting from the first observation
lastNObservations	Positive integer	Integer specifying the maximum number of observations to be returned for each of the matching series, counting back from the most recent observation
dimensionAtObservation	A string compliant with the SDMX common:NCNameIDType	The ID of the dimension to be attached at the observation level. This parameter allows the client to indicate how the data should be packaged by the service. The options are "TIME_PERIOD" (a timeseries view of the data), the ID of any other

<sup>19</sup> If the information about when the data has been updated is not available at the observation level, the web service should return either the series that have changed (if the information is attached at the series level) or the dataflows that have changed (if the information is attached at the dataflow level).

		<p>dimension used in that dataflow (a cross-sectional view of the data) or the keyword "AllDimensions" (a "flat" view of the data where the observations are grouped neither by time nor by a non-time cross section). In case this parameter is not set, the service is expected to:</p> <ul style="list-style-type: none"> <li>- Default to TimeDimension, if the data structure definition has one;</li> <li>- If not, default to MeasureDimension , if the data structure definition has one;</li> <li>- If none of the above is true, default to AllDimensions.</li> </ul>
detail	String	<p>This attribute specifies the desired amount of information to be returned. For example, it is possible to instruct the web service to return data only (i.e. no attributes). Possible options are: "full" (all data and documentation, including annotations - This is the default), "dataonly" (attributes – and therefore groups – will be excluded from the returned message), "serieskeyonly" (returns only the series elements and the dimensions that make up the series keys. This is useful for performance reasons, to return the series that match a certain query, without returning the actual data), "nodata" (returns the groups and series, including attributes and annotations, without observations).</p>

373 The table below defines the meaning of parameters combinations:

startPeriod with no endPeriod	Until the most recent
endPeriod and no startPeriod	From the beginning
startPeriod and endPeriod	Within the supplied time range
lastNObservations + startPeriod/endPeriod	The specified number of observations, starting from the end, within the supplied time range
firstNObservations + startPeriod/endPeriod + updatedAfterDate	The specified number of observations, starting from the beginning, that have changed since the supplied timestamp, within the supplied time range
updatedAfterDate + startPeriod/endPeriod	The observations, within the supplied time range, that have changed since the supplied timestamp.

### 374 4.4.3 Examples

- 375 • To retrieve the data for the series M.USD.EUR.SP00.A supplied by the ECB for the  
376 ECB\_EXR1\_WEB dataflow:

377 [http://ws-entry-point/data/ECB\\_EXR1\\_WEB/M.USD.EUR.SP00.A/ECB](http://ws-entry-point/data/ECB_EXR1_WEB/M.USD.EUR.SP00.A/ECB)

378 In this example, the assumption is made that the dataflow id (ECB\_EXR1\_WEB) is  
379 sufficient to uniquely identify the dataflow, and the data provider id (ECB) is sufficient  
380 to uniquely identify the data provider.

- 381 • To retrieve the data, provided by the ECB for the ECB\_EXR1\_WEB dataflow, for the  
382 supplied series keys, using wildcarding for the second dimension:

383 [http://ws-entry-point/data/ECB,ECB\\_EXR1\\_WEB,latest/M..EUR.SP00.A/ECB](http://ws-entry-point/data/ECB,ECB_EXR1_WEB,latest/M..EUR.SP00.A/ECB)

384 In this example, the full reference to the dataflow is supplied (ECB as maintenance  
385 agency, ECB\_EXR1\_WEB as dataflow id and latest for the version).

- 386 • To retrieve the updates and revisions for the data matching the supplied series keys,  
387 using the OR operator for the second dimension, and using percent encoding for the  
388 updatedAfterDate:

389 [http://ws-entry-  
390 point/Data/ECB\\_EXR1\\_WEB/M.USD+GBP+JPY.EUR.SP00.A?updatedAfter=2  
391 009-05-15T14 %3A 15 %3A 00%2B01%3A00](http://ws-entry-point/Data/ECB_EXR1_WEB/M.USD+GBP+JPY.EUR.SP00.A?updatedAfter=2009-05-15T14%3A15%3A00%2B01%3A00)

- 392 • To retrieve the data matching the supplied series key and restricting the start and end  
393 dates:

394 [http://ws-entry-  
395 point/data/ECB\\_EXR1\\_WEB/D.USD.EUR.SP00.A?startPeriod=2009-05-  
396 01&endPeriod=2009-05-31](http://ws-entry-point/data/ECB_EXR1_WEB/D.USD.EUR.SP00.A?startPeriod=2009-05-01&endPeriod=2009-05-31)

## 397 4.5 Schema queries

### 398 4.5.1 Resources

399 The following resource is defined:

- 400       • schema

401  
402 This resource allows a client to ask a service to return an XML schema, which defines data  
403 (or reference metadata) validity within a certain context. The service must take into account  
404 the constraints that apply within that context (DSD or MSD, dataflow or metadataflow, or  
405 provision agreement).

## 406    **4.5.2 Parameters**

### 407    **4.5.2.1 Parameters used for identifying a resource**

408    The following parameters are used for identifying resources:

Parameter	Type	Description
context	One of the following: datastructure, metadatastructure, dataflow, metadataflow or provisionagreement.	The value of this parameter determines the constraints that need to be taken into account, when generating the schema. If datastructure or metadatastructure is used, constraints attached to the DSD or MSD must be applied when generating the schema. If dataflow or metadataflow is used, constraints attached to the dataflow or metadataflow and to the DSD or MSD used in the dataflow or metadataflow must be applied when generating the schema. If provisionagreement is used, constraints attached to the provision agreement, as well as to the dataflow or metadataflow used in the agreement and the DSD or MSD used in the dataflow or metadataflow must be applied when generating the schema.
agencyID	A string compliant with the SDMX common:NCNameIDType	The agency maintaining the artefact used to generate the schema to be returned.
resourceID	A string compliant with the SDMX common: IDType	The id of the artefact used to generate the schema to be returned.
version	A string compliant with the SDMX common:VersionType	The version of the artefact used to generate the schema to be returned.

409    The parameters mentioned above are specified using the following syntax:

410    protocol://ws-entry-point/schema/context/agencyID/resourceID/version

411    Furthermore, a keyword may be used<sup>20</sup>:

Keyword	Scope	Description

<sup>20</sup> As the query for schema must match one artefact only, the keyword “all” is not supported for agencyId and resourceId.

latest	version	Returns the latest version in production of the resource
--------	---------	--

412

413 The following rules apply:

- 414 • If no version attribute is specified, the version currently used in production should be  
415 returned. It is therefore equivalent to using the keyword "latest".

#### 416 **4.5.2.2 Parameters used to further describe the desired results**

417 The following parameters are used to further describe the desired results, once the resource  
418 has been identified:

Parameter	Type	Description
dimensionAtObservation	A string compliant with the SDMX common: NCNameIDType	The ID of the dimension to be attached at the observation level.
explicitMeasure	Boolean	For cross-sectional data validation, indicates whether observations are strongly typed (defaults to false).

#### 419 **4.5.3 Examples**

420

421 - To retrieve the schema for data supplied within the context of version 1.0 of the provision  
422 agreement EXR\_WEB maintained by the ECB:

423 [http://ws-entry-point/schema/provisionagreement/ECB/ EXR\\_WEB/1.0/](http://ws-entry-point/schema/provisionagreement/ECB/EXR_WEB/1.0/)

424 In this case, the schema returned by the service must take into account the  
425 constraints attached to the provision agreement, the dataflow used in the provision  
426 agreement and the data structure definition used in the dataflow.

#### 427 **4.6 Selection of the Appropriate Representation**

428 Selection of the appropriate formats for the response message is made using the  
429 mechanisms defined for HTTP Content Negotiation<sup>21</sup>. Using the HTTP Content Negotiation  
430 mechanism, the client specifies the desired format and version of the resource using the  
431 Accept HTTP header<sup>22</sup>.

432 Along with official mime types (e.g.: text/html, application/xml, etc), the standard also defines  
433 a syntax allowing a service to define its own types. The SDMX Restful API makes use of this  
434 functionality and the syntax is as follows:

<sup>21</sup> For additional information, please refer to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec12.html>

<sup>22</sup> For additional information, please refer to <http://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html>

435 application/vnd.sdmx.[format]+xml;version=[version<sup>23</sup>], where [format] should be replaced with  
 436 the desired format (i.e. : genericdata, structurespecificdata, structure, etc) and [version]  
 437 should be replaced with one of the versions of the SDMX standard, starting with SDMX 2.1  
 438 (e.g.: 2.1, future SDMX versions, etc).

439 A few examples are listed below

- 440 • SDMX-ML Generic Data Format, version 2.1:  
441 application/vnd.sdmx.genericdata+xml;version=2.1
- 442 • SDMX-ML Structure Specific Data Format, version 2.1:  
443 application/vnd.sdmx.structurespecificdata+xml;version=2.1
- 444 • SDMX-ML Structure Format, version 2.1:  
445 application/vnd.sdmx.structure+xml;version=2.1  
446

447 In case the client does not specify the desired format and version of the response message,  
 448 or only specifies the generic application/xml format, the SDMX RESTful web service should  
 449 return:

- 450 • The most recent version, that the service supports, of the SDMX-ML Structure format  
451 for structural metadata queries;
- 452 • The most recent version, that the service supports, of the SDMX-ML Generic Data  
453 format for data queries;
- 454 • The most recent version, that the service supports, of the SDMX-ML Generic  
455 Metadata format for metadata queries.  
456

457 The list below indicates the valid formats for SDMX RESTful web services, compliant with  
 458 version 2.1 of the SDMX standard:

- 459 • application/vnd.sdmx.genericdata+xml;version=2.1
- 460 • application/vnd.sdmx.structurespecificdata+xml;version=2.1
- 461 • application/vnd.sdmx.generictimeseriesdata+xml;version=2.1
- 462 • application/vnd.sdmx.structurespecifictimeseriesdata+xml;version=2.1
- 463 • application/vnd.sdmx.genericmetadata+xml;version=2.1
- 464 • application/vnd.sdmx.structurespecificmetadata+xml;version=2.1
- 465 • application/vnd.sdmx.structure+xml;version=2.1
- 466 • application/vnd.sdmx.schema+xml;version=2.1

## 467 **4.7 Enabling data compression**

468 Compression should be enabled using the appropriate HTTP Header field (Accept-  
 469 Encoding).

## 470 **5 Standard Errors for SDMX Web Services**

### 471 **5.1 Introduction**

472 In SDMX-ML version 2.1 an error element has been implemented in all messages that would  
 473 normally be a response to a query, that is: Structure, MetadataStructure, GenericData,  
 474 DSDData and Metadata. In case of an error the error element will be added to the  
 475 structure:Structures | generic:GenericDataSet | message:DataSet |

---

<sup>23</sup> For the time being, only version 2.1 is supported as version number.

476 genericmetadata:MetadataSet | metadatareport:MetadataSet element in the response  
477 message.

478 The element belongs to Message schemas and use the StatusTextType from the Common  
479 schema file. In the end of this document is an extract from the schema files showing the error  
480 element.

481 The error part of the XML message supports the 2 following use cases:

- 482
- Any error which is detected before SDMX data is streamed to the client will be  
483 returned in the Error element defined in the SDMX message namespace.
  - If the error occurs after some SDMX data has already been streamed to the client,  
484 the error information will be supplied via a “footer” element in the SDMX payload.  
485

## 486 **5.2 Error handling in REST Web Service**

487 RESTful web services should indicate errors using the proper HTTP status code. In addition,  
488 whenever appropriate, the error should also be returned using the error message offered  
489 starting with version 2.1 of SDMX-ML.

## 490 **5.3 SOAP Web Service**

491 SOAP web services should indicate errors using the standard SOAP error mechanism, using  
492 the specific namespace created for this purpose. In addition, whenever appropriate<sup>24</sup>, the  
493 error should also be returned using the error message offered starting with version 2.1 of  
494 SDMX-ML.

495 In case of error, the following elements should be set in the SOAP Envelope:

- 496
- the <faultcode> element for the error number
  - 497 • the <faultstring> element for the description
  - 498 • the <faultactor> element for the webservice method with the url for the webservice  
499 prefixed
  - 500 • The <detail> element is optional, and can be used by the service provider to provide  
501 any additional information deemed useful

## 502 **5.4 Error categories**

503 The numbering of error messages divides the three types of messages up, and provides for  
504 web services to implement custom messages as well:

- 505
- 000 – 499: Client-caused "errors"
  - 506 • 500 – 999: Server-caused "errors"
  - 507 • 1000 and up: Custom Messages

## 508 **5.5 Client-Caused Errors**

### 509 **5.5.1 No results found – 100**

510 There is no difference between SOAP and REST webservices for this message. If the result  
511 from the query is empty the webservice should return this message. This is a way to inform  
512 the client that the result is empty.

---

<sup>24</sup> According to the SOAP version Framework 1.2, it is not possible to place both a <faultcode> element and return other information.

513 **5.5.2 Unauthorized – 110**

514 For use when authentication is needed but has failed or has not yet been provided.

515 **5.5.3 Response Too Large Due to Client Request 130**

516 The request results in a response that is larger than the client is willing or able to process.  
517 The client has the possibility, using SDMX-ML query, to limit the size of the response returned  
518 by the server. In case the response is larger than the limit set by the client, the server should  
519 return this error code.

520 **5.5.4 Syntax error – 140**

521 This error code is used when:

522 - SOAP: The supplied SDMX-ML Query message is invalid (XML validation fails)

523 - REST: The query string doesn't comply with the SDMX RESTful interface.

524 **5.5.5 Semantic error – 150**

525 A web service should return this error when a request is syntactically correct but fails a  
526 semantic validation or violates agreed business rules.

527 **5.6 Server-Caused Errors**

528 **5.6.1 Internal Server Error – 500**

529 The webservice should return this error code when none of the other error codes better  
530 describes the reason for the failure of the service to provide a meaningful response.

531 **5.6.2 Not implemented – 501**

532 If the webservice has not yet implemented one of the methods defined in the API, then the  
533 webservice should return this error.

534 Note: All SDMX web services should implement all the standard interfaces, even if their only  
535 function is to return this error message. This eases interoperability between SDMX-compliant  
536 web services and it also eases the development of generic SDMX web services clients.

537 **5.6.3 Service unavailable – 503**

538 If a web service is temporarily unavailable because of maintenance or for some other similar  
539 reasons, then the webservice should return this error code.

540 **5.6.4 Response size exceeds service limit - 510**

541 The request results in a response that is larger than the server is willing or able to process.

542 In case the service offers the possibility to users to download the results of large queries at a  
543 later stage (for instance, using asynchronous web services), the web service may choose to

544 indicate the (future) location of the file, as part of the error message. In SOAP, this can be  
545 done using the error element <faultstring>.

## 546 **5.7 Custom Errors - 1000+**

547 Web services can use codes 1000 and above for the transmission of service-specific error  
548 messages. However, it should be understood that different services may use the same  
549 numbers for different errors, so the documentation provided by the specific service should be  
550 consulted when implementing this class of errors.

## 551 **5.8 SDMX to HTTP Error Mapping**

552 The following table maps the SDMX error codes with the HTTP status code for RESTful web  
553 services and indicates how the errors should be returned in SOAP.

<b>SDMX error</b>	<b>HTTP error usage in REST</b>	<b>SOAP usage</b>
<b>Client errors</b>		
100 No results found	404 Not found	SOAP Fault
110 Unauthorized	401 Unauthorized	SOAP Fault
130 Response too large due to client request	413 Request entity too large	SOAP Fault
140 Syntax error	400 Bad syntax	SOAP Fault
150 Semantic error	400 Bad syntax	SOAP Fault
<b>Server errors</b>		
500 Internal Server error	500 Internal server error	SOAP Fault
501 Not implemented	501 Not implemented	SOAP Fault
503 Service unavailable	503 Service unavailable	SOAP Fault
510 Response size exceeds service limit	413 Request entity too large	Payload
1000+	500 Internal server error	SOAP Fault

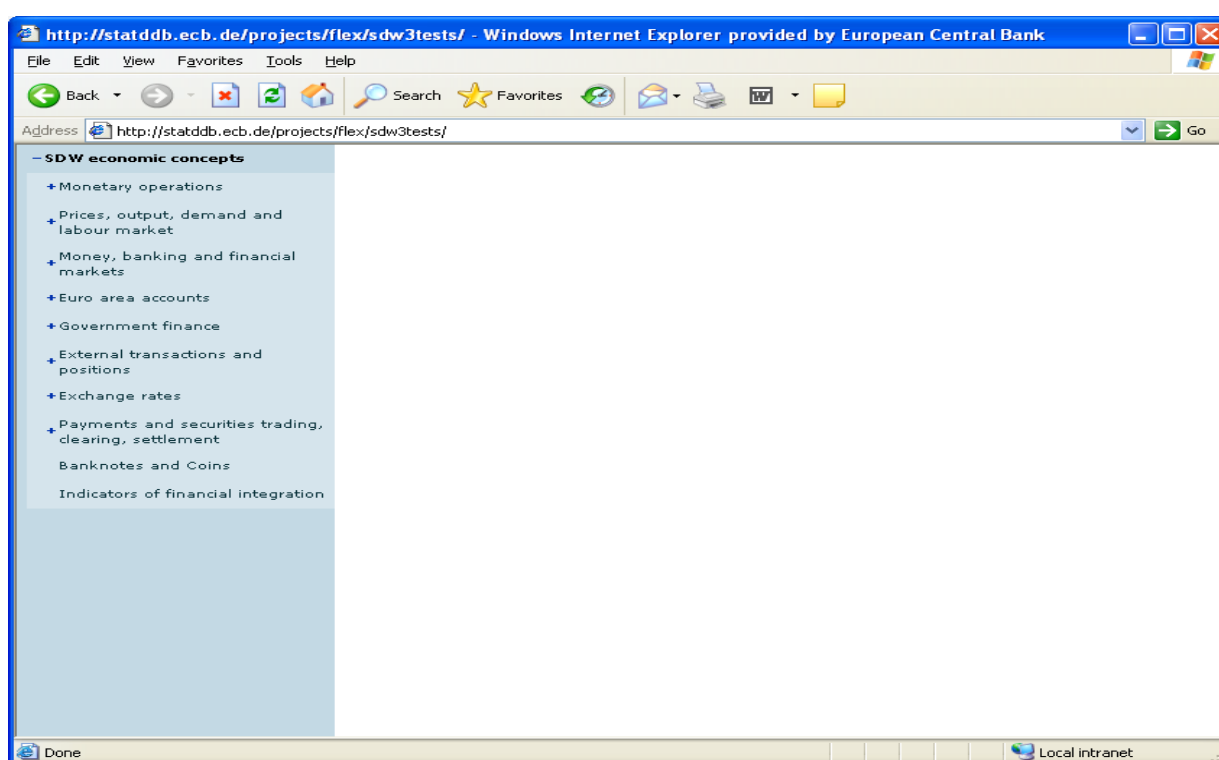

554 **6 Annex: Examples**

555 **6.1 Sample Queries for a Web Services Client**

556 **6.1.1 Step 1: Browsing an SDMX data source, using a list of subject-**  
557 **matter domains**

558 **6.1.1.1 Use case**

559 The web client offers the possibility to retrieve data by browsing a list of subject matter  
560 domains. The client requests the version currently in production of the SDW\_ECON category  
561 scheme, maintained by the ECB.

562

563 **6.1.1.2 Request using the RESTful API**

564 [http://ws-entry-point/categoryscheme/ECB/SDW\\_ECON?references=categorisation](http://ws-entry-point/categoryscheme/ECB/SDW_ECON?references=categorisation)

565 Note: Using the references attribute with a value of "categorisation", the categorisations used  
566 by the category scheme will also be returned and these will contain references to the  
567 dataflows attached to the categories.

568 **6.1.1.3 Request using the SOAP API**

```
569 <query:CategorySchemeQuery referenceResolution="Shallow">
570   <query:References>
571     <query:Default/>
572   </query:References>
573 </query:CategorySchemeWhere>
```

```
574         <query:ID>SDW_ECON</query:ID>
575         <query:AgencyID>ECB</query:AgencyID>
576         </query:CategorySchemeWhere>
577 </query:CategorySchemeQuery>
578
```

579 Note: For the sake of clarity, the SOAP envelope has been omitted.

#### 580 **6.1.1.4 Response**

581 An SDMX-ML Structure message containing the category schemes, as well as the  
582 categorisations with references to the dataflows will be returned. The structure of the SDMX-  
583 ML Structure message will be as follow (root element, header and repeated elements omitted  
584 for the sake of clarity):

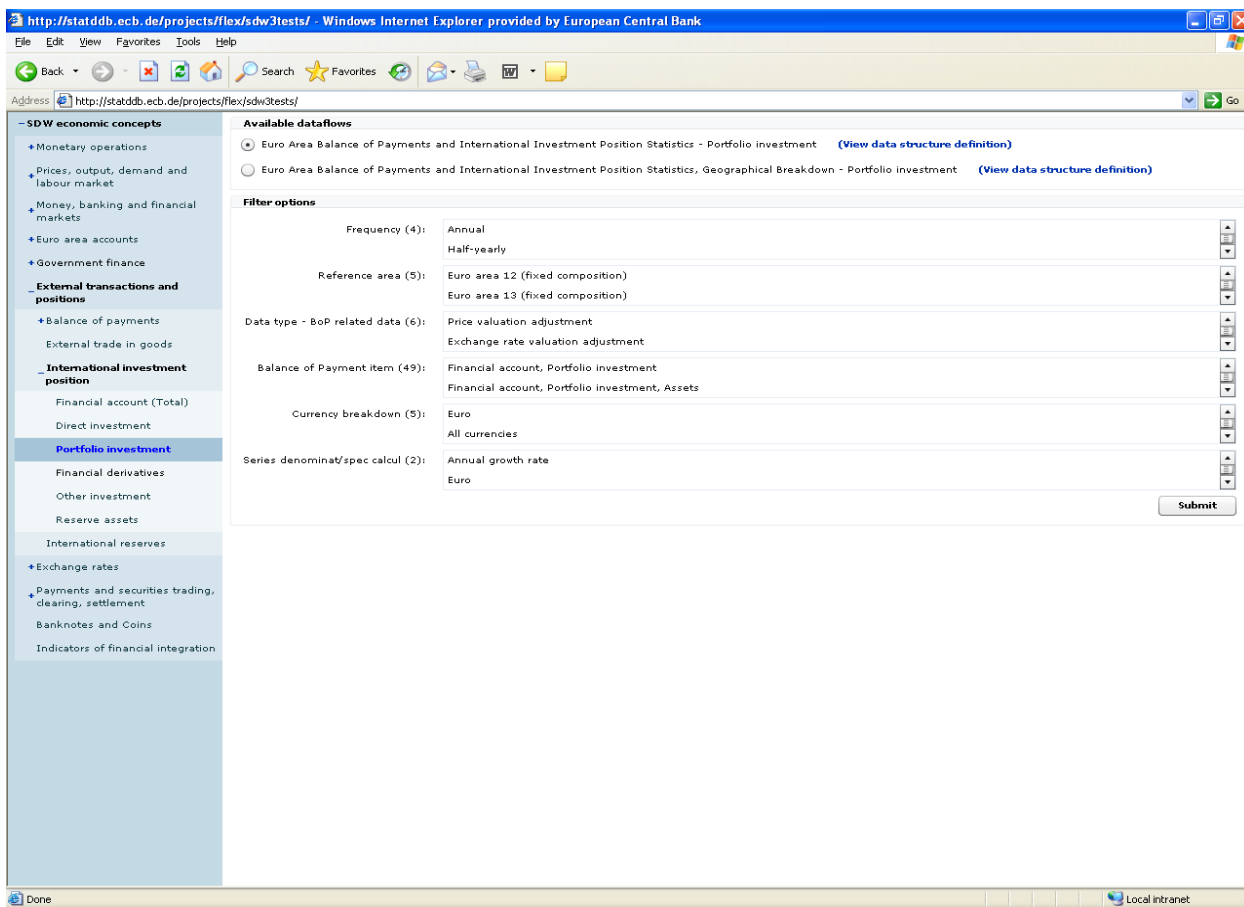

```
585 <structure:Structures>
586     <structure:CategorySchemes>
587         <structure:CategoryScheme>
588         </structure:CategoryScheme>
589     </structure:CategorySchemes>
590     <structure:Categorisations>
591         <structure>DataflowCategorisation>
592         </structure>DataflowCategorisation>
593     </structure:Categorisations>
594 </structure:Structures>
```

#### 595 **6.1.2 STEP 2: Selecting a dataflow**

##### 596 **6.1.2.1 Use case**

597 Once a subject-matter domain and a dataflow have been selected, a filter box needs to be  
598 populated, to allow users to select data. In order to only create queries for data that actually  
599 exist in the database, the dataflow constraints will also be requested.

The screenshot shows a web browser window with the URL `http://statddb.ecb.de/projects/flex/sdw3tests/`. The page displays a navigation menu on the left under the heading "SDW economic concepts". The main content area is titled "Available dataflows" and shows two radio buttons for selecting a dataflow: "Euro Area Balance of Payments and International Investment Position Statistics - Portfolio investment" (selected) and "Euro Area Balance of Payments and International Investment Position Statistics, Geographical Break-down - Portfolio investment". Below this is a "Filter options" section with several dropdown menus:

- Frequency (4): Annual, Half-yearly
- Reference area (5): Euro area 12 (fixed composition), Euro area 13 (fixed composition)
- Data type - BoP related data (6): Price valuation adjustment, Exchange rate valuation adjustment
- Balance of Payment item (49): Financial account, Portfolio investment; Financial account, Portfolio investment, Assets
- Currency breakdown (5): Euro, All currencies
- Series denominat/spec calcul (2): Annual growth rate, Euro

A "Submit" button is located at the bottom right of the filter options section.

600

### 601 6.1.2.2 Request using the RESTful API

602 In this sample query, the dataflow id is 123456, the agency id is ECB and the version is 1.2.  
603 Using the references attribute, the data structure definition and the constraints will also be  
604 returned.

605 `http://ws-entry-point/dataflow/ECB/123456/1.2?references=all`

### 606 6.1.2.3 Request using the SOAP API

```
607 <query:DataflowQuery>
608     <query:References>
609         <query:Default/>
610     </query:References>
611 <query:DataflowWhere>
612     <query:ID>123456</query:ID>
613     <query:Version>1.2</query:Version>
614     <query:AgencyID>ECB</query:AgencyID>
615 </query:DataflowWhere>
616 </ query:DataflowQuery>
```

### 617 6.1.2.4 Response

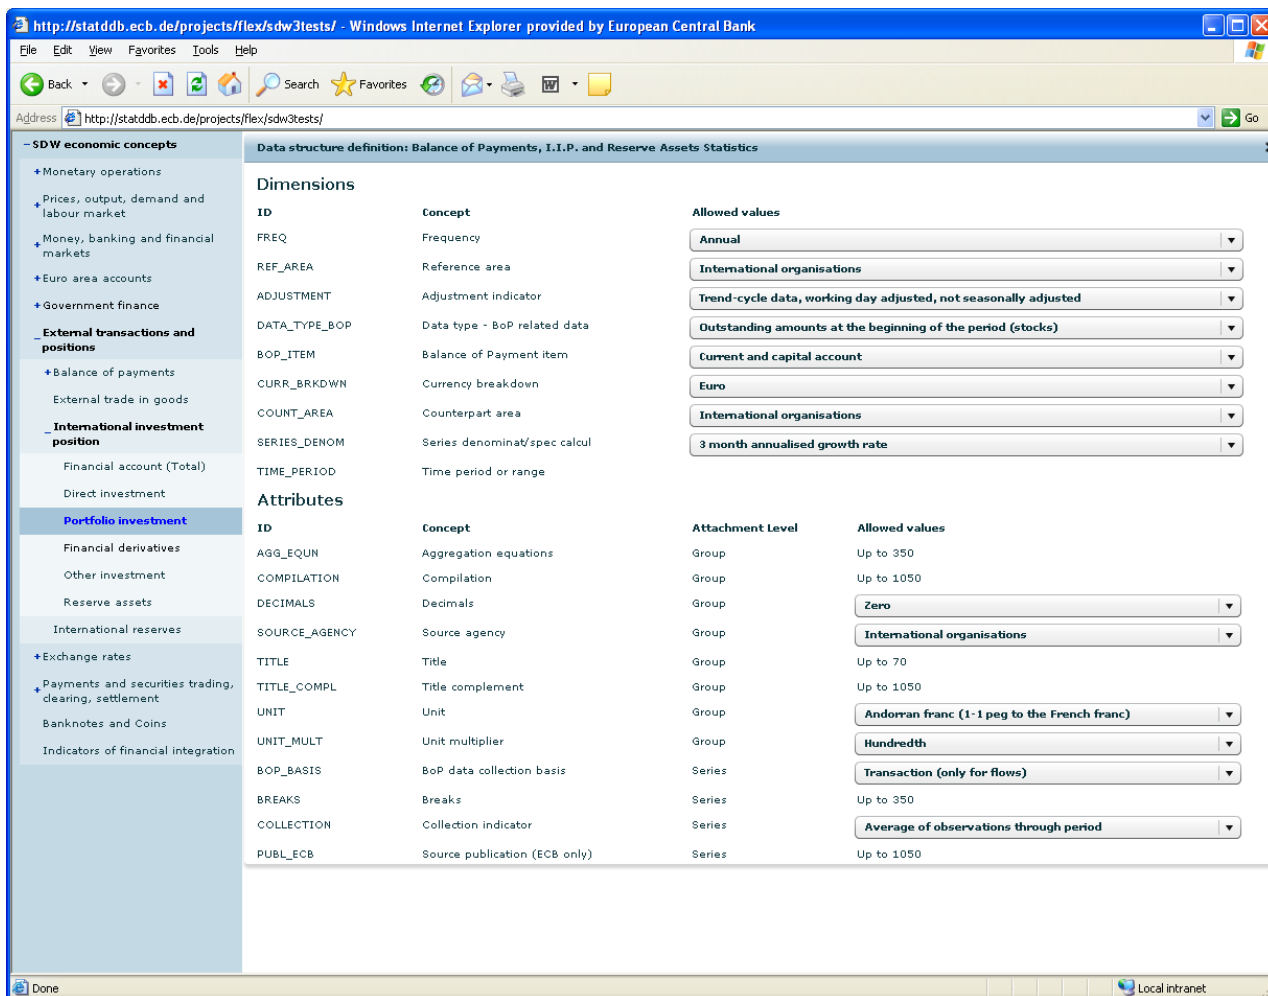

618 An SDMX-ML Structure message containing the requested dataflow, as well as the data  
619 structure definition and the dataflow constraints attached. The structure of the SDMX-ML  
620 Structure message will be as follows (root element and header omitted):

```

621 <structure:Structures>
622     <structure:Dataflows>
623         <structure:Dataflow>
624         </structure:Dataflow>
625     </structure:Dataflows>
626 <structure:Codelists>
627 </structure:Codelists>
628 <structure:Concepts>
629 </structure:Concepts>
630 <structure>DataStructures>
631 </structure>DataStructures>
632 <structure:Constraints>
633     <structure:ContentConstraint>
634     </structure:ContentConstraint>
635 </structure:Constraints>
636 </structure:Structures>

```

637  
638 If, before selecting data, the user wants to review the data structure definition used by the  
639 dataflow, this can be done without sending an additional query, as this information has  
640 already been included in the response.

http://statddb.ecb.de/projects/flex/sdw3tests/ - Windows Internet Explorer provided by European Central Bank

Address http://statddb.ecb.de/projects/flex/sdw3tests/

**Data structure definition: Balance of Payments, I.I.P. and Reserve Assets Statistics**

**Dimensions**

ID	Concept	Allowed values
FREQ	Frequency	Annual
REF_AREA	Reference area	International organisations
ADJUSTMENT	Adjustment indicator	Trend-cycle data, working day adjusted, not seasonally adjusted
DATA_TYPE_BOP	Data type - BoP related data	Outstanding amounts at the beginning of the period (stocks)
BOP_ITEM	Balance of Payment item	Current and capital account
CURR_BRKDOWN	Currency breakdown	Euro
COUNT_AREA	Counterpart area	International organisations
SERIES_DENOM	Series denominat/spec calcul	3 month annualised growth rate
TIME_PERIOD	Time period or range	

**Attributes**

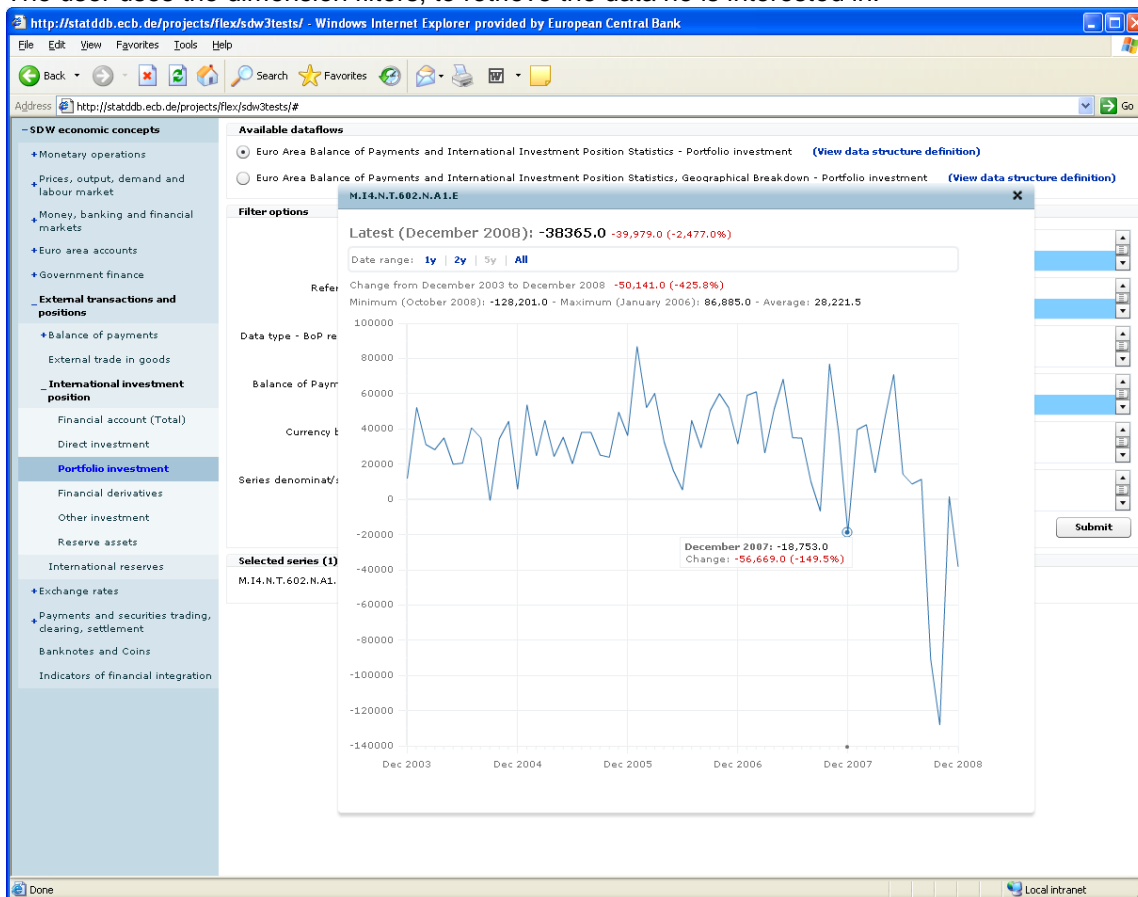

ID	Concept	Attachment Level	Allowed values
AGG_EQUN	Aggregation equations	Group	Up to 350
COMPILATION	Compilation	Group	Up to 1050
DECIMALS	Decimals	Group	Zero
SOURCE_AGENCY	Source agency	Group	International organisations
TITLE	Title	Group	Up to 70
TITLE_COMPL	Title complement	Group	Up to 1050
UNIT	Unit	Group	Andorran franc (1·1 peg to the French franc)
UNIT_MULT	Unit multiplier	Group	Hundredth
BOP_BASIS	BoP data collection basis	Series	Transaction (only for flows)
BREAKS	Breaks	Series	Up to 350
COLLECTION	Collection indicator	Series	Average of observations through period
PUBL_ECB	Source publication (ECB only)	Series	Up to 1050

641 Done Local intranet

642 **6.1.3 STEP 3: Data selection**

643 **6.1.3.1 Use case**

644 The user uses the dimension filters, to retrieve the data he is interested in.

645

646 **6.1.3.2 Request using the RESTful API**

647 `http://ws-entry-point/data/123456/M.I4.N.9.339+340+341.N.A1.A/ECB?startPeriod=2009-`  
648 `01&endPeriod=2009-12&detail=dataonly`

649 Note: Apart from the dataflow id (123456), the data provider is set to ECB, and the series key  
650 uses the OR operator for the 5<sup>th</sup> dimension. Furthermore, only data for 2009 should be  
651 returned. As the purpose of the returned data is to be displayed on a graph, the detail level is  
652 set to data only. Therefore, attributes and groups will be excluded from the returned message.  
653 Regarding the references to the dataflow, the short form is used, as, for this particular web  
654 service, the dataflow id and the data provider id are sufficient to uniquely identify the dataflow  
655 and the data provider respectively. Should this not be the case, the full reference must be  
656 supplied (for example, ECB+123456+1.2 instead of 123456).

657 **6.1.3.3 Request using the SOAP API**

658 `<query:Query>`  
659 `<query:DataWhere>`  
660 `<query:DataProvider>`  
661 `<common:OrganisationSchemeRef>`

```

662         <common:AgencyID>ECB</common:AgencyID>
663         <common:ID>DataProviderScheme</common:ID>
664         </common:OrganisationSchemeRef>
665         <common:DataProviderRef>
666             <common:ID>ECB</common:ID>
667         </common:DataProviderRef>
668     </query:DataProvider>
669 <query:StructureUsage>
670     <common:DataflowReference>
671         <common:Ref>
672             <common:AgencyID>ECB</common:AgencyID>
673             <common:ID>123456</common:ID>
674             <common:Version>1.2</common:Version>
675         </common:Ref>
676     </common:DataflowReference>
677 </query:StructureUsage>
678 <query:DimensionValue>
679     <query:ID>FREQ</query:ID>
680     <query:Value>M</query:Value>
681 </query:DimensionValue>
682 <query:DimensionValue>
683     <query:ID>REF_AREA</query:ID>
684     <query:Value>I4</query:Value>
685 </query:DimensionValue>
686 <query:DimensionValue>
687     <query:ID>ADJUSTMENT</query:ID>
688     <query:Value>N</query:Value>
689 </query:DimensionValue>
690 <query:DimensionValue>

693 </query:DimensionValue>
694 <query:DimensionValue>
695     <query:ID>CURR_BRKDOWN</query:ID>
696     <query:Value>N</query:Value>
697 </query:DimensionValue>
698 <query:DimensionValue>
699     <query:ID>COUNT_AREA</query:ID>
700     <query:Value>A1</query:Value>
701 </query:DimensionValue>
702 <query:DimensionValue>
703     <query:ID>SERIES_DENOM</query:ID>
704     <query:Value>A</query:Value>
705 </query:DimensionValue>
706 <query:TimeDimensionValue>
707     <query:ID>TIME_PERIOD</query:ID>
708     <query:TimeValue>
709 operator="GreaterThanOrEqualTo">2009-01</query:TimeValue>
710     <query:TimeValue>
711 operator="LessThanOrEqualTo">2010-12</query:TimeValue>
712 </query:TimeDimensionValue>
713 <query:Or>

```

```

714         <query:DimensionValue>
715             <query:ID>BOP_ITEM</query:ID>
716             <query:Value>339</query:Value>
717         </query:DimensionValue>
718         <query:DimensionValue>
719             <query:ID>BOP_ITEM</query:ID>
720             <query:Value>340</query:Value>
721         </query:DimensionValue>
722         <query:DimensionValue>
723             <query:ID>BOP_ITEM</query:ID>
724             <query:Value>341</query:Value>
725         </query:DimensionValue>
726     </query:Or>
727 </query:DataWhere>
728 </query:Query>

```

### 729 **6.1.3.4 Response**

730 An SDMX-ML Generic data message containing the requested time series.

731 The structure of the SDMX-ML Data message will be as follows (root element and header  
732 omitted):

```

733 <message:DataSet>
734     <generic:Series>
735     </generic:Series>
736 </message:DataSet>

```

## 737 **6.2 Sample Error Element in an SDMX message**

```

738 <xs:element name="Error" type="ErrorType">
739     <xs:annotation>
740         <xs:documentation>Error is used to communicate
741             that an error has occurred when responding to a
742             request in a non-registry environment. The
743             content will be a collection of error messages.
744         </xs:documentation>
745     </xs:annotation>
746 </xs:element>
747 <xs:complexType name="ErrorType">
748     <xs:annotation>
749         <xs:documentation>ErrorType describes the
750             structure of an error response.
751         </xs:documentation>
752     </xs:annotation>
753     <xs:sequence>
754         <xs:element name="ErrorMessage"
755             type="common:StatusTextType" maxOccurs="unbounded">
756             <xs:annotation>
757                 <xs:documentation>ErrorMessage
758                 contains the error message. It can

```

```

759         occur multiple times to communicate
760         message for multiple errors, or to
761         communicate the error message in
762         parallel languages. If both messages
763         for multiple errors and parallel
764         language messages are used, then each
765         error message should be given a code
766         in order to distinguish message for
767         unique errors.
768         </xs:documentation>
769     </xs:annotation>
770 </xs:element>
771 </xs:sequence>
772 </xs:complexType>

```

### 773 **6.3 Soap Fault example**

```

774 <?xml version = "1.0" encoding = "UTF-8" ?>
775 <soapenv:Envelope
776 xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/"
777 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
778 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
779 xmlns:sdmxerror="http://www.SDMX.org/resources/SDMXML/webService/iso/v\_
780 2\_0\_draft/error"

781
782 xmlns:sdmxws="http://www.SDMX.org/resources/SDMXML/webService/iso/v\_2\_
783 0\_draft">
784 <soapenv:Body>
785 <soapenv:Fault>
786 <faultcode>sdmxerror:500</faultcode>
787 <faultstring>Internal server error</faultstring>
788 <faultactor>sdmxws:GetCodelist</faultactor>
789 <detail>
790 <sdmxws:composite>
791 <sdmxws:code>1028</sdmxws:code>

794 <sdmxws:title lang="en">Could not get connection from pool</sdmxws:title>
795 <sdmxws:title lang="fr">Could not get connection from pool</sdmxws:title>
796 </sdmxws:titles>
797 <sdmxws:source>SdmxRegistryService error: could not get connection from
798 pool</sdmxws:source>
799 </sdmxws:composite>
800 </detail>
801 </soapenv:Fault>
802 </soapenv:Body>
803 </soapenv:Envelope>

```

## 804 **7 Annex: Security guidelines**

805 This annex describes useful security measures for SDMX web services<sup>25</sup>.

### 806 **7.1 Authentication**

807 Authentication refers to the process of uniquely identifying an entity. In the context of a web  
808 service, service authentication and client authentication are distinct.

#### 809 **7.1.1 Server authentication**

810 Clients of web services have a high interest in ensuring that they are connected to the service  
811 they intend to consume and not to a rogue service masquerading as a trusted entity. To  
812 support this, use SSL/TLS<sup>26</sup> and offer clients the possibility to consume the web service over  
813 HTTPS.

#### 814 **7.1.2 Client authentication**

815 When restrictions apply to the data and metadata published, it is important for the service  
816 provider to be able to uniquely identify the client.

817 For RESTful web services, support this requirement by using HTTP basic authentication over  
818 SSL/TLS<sup>27</sup>. If stronger authentication is required, use SSL client certificates instead.

819 HTTP basic authentication over SSL/TLS can also be used to support authentication in SOAP  
820 web services. In situations where this is not appropriate, use industry standard such as  
821 OASIS Web Services Security (WSS) Specification. Use and declare a standard token profile  
822 in WS-Policy assertions. Include and explicitly declare WS Security assertions and  
823 requirements the WSDL file with a standard targeted namespace and security token  
824 information.

### 825 **7.2 Confidentiality**

826 Confidentiality refers to the process of guaranteeing that resources cannot be accessed by  
827 unauthorised users.

828 This requirement is a key requirement for the SDMX web services when restrictions apply to  
829 the data and metadata published, as both clients and services have a high interest in  
830 ensuring their data is not illegally accessed. For these web services, use SSL/TLS<sup>28</sup> to  
831 support confidentiality during the transfer between the service and the client using.

### 832 **7.3 Integrity**

833 Integrity refers to the process of guaranteeing that resources cannot be accidentally or  
834 maliciously modified.

---

<sup>25</sup> This annex is not comprehensive, as security-related measures for SDMX web services will vary according to the scope of the web service and the security policies of the organisation maintaining the web service.

<sup>26</sup> This allows the client to validate that the certificate matches the domain name of the service, is issued by a trusted authority, and is not expired.

<sup>27</sup> See [RFC 2617](#) for additional information.

<sup>28</sup> SSL/TLS supports this requirement using a combination of symmetric and asymmetric encryption.

835 Support this requirement using SSL/TLS<sup>29</sup>.

---

<sup>29</sup> SSL/TLS supports this requirement by calculating a message digest.
